272	ZA5664/5	36.0.0	z000011a		major	deletion		cdb / dataset	The calculation of the standardized design weight (z000011a) is incorrect. Instead of standardizing on the net sample of the respective recruitment interview, the non-standardized weights (z000010a) were divided by population size and then multiplied by the gross of both samples from 2013 and 2016. Although the weights are in the right order of magnitude, the procedure is imprecise. The sum of the weights thus deviates not insignificantly from the net sample and the average of the standardized weights is no longer one.

The actual purpose of the standardization is therefore no longer fulfilled. This means that the use of weights may result in misinterpretations.

With regard to possible bias, as long as the net sample size does not play a role in the analysis and the analysis has been carried out correctly, the bias is rather unproblematic. How strong the bias is ultimately and whether it is negligible, depends on the approach taken in the analysis, i.e. whether correctly the sum of the weights or incorrectly the net sample size has been used.

The non-standardized design weights (z000010a and z000010b) and the inclusion probabilities (z000012a and z000012b) are not affected!

For more detail on the matter of weighting, please take a look at the Data Manual (ZA5664-65_sd_data-manual). | Instrument specific standardized design weights will be provided with the publication of the following wave. |
