V2092 [F84a. operation: usefulness]
F84. Now I am going to describe you a situation in a hospital and then ask you for your opinion about it: Three patients are admitted to a hospital at the same time, all suffering from a form of heart disease requiring surgery. However, the limited resources of the hospital allow only one heart operation each month. All three cases are equally urgent. The patient who is treated first will have a better chance of survival. Now can you tell me what would be your view of each one of the following decisions, using the scale from this card.

The decision is made by judging the usefulness of each patient for society at large.

Note: Since 2006 variable is part of the international questionnaire. Data of ALL YEARS is now filed as V50228.

---

V2093 [F84b. operation: hospital regulations]

---

V2094 [F84c. operation: money]
The patient who can afford to pay most is treated first.

Note: Since 2006 variable is part of the international questionnaire. Data of ALL YEARS is now filed as V50230.

---

V2095 [F84d. operation: largest family]
The patient supporting the largest family is treated first.

Note: Since 2006 variable is part of the international questionnaire. Data of ALL YEARS is now filed as V50231.

---

V2096 [F84e. operation: decision of families]
The families of the patients are left to decide amongst themselves.

Note: Since 2006 variable is part of the international questionnaire. Data of ALL YEARS is now filed as V50232.

---

V2097 [F84f. operation: lottery]
The decision about which patient goes first is made by a lottery.

Note: Since 2006 variable is part of the international questionnaire. Data of ALL YEARS is now filed as V50233.
F85. I will describe another situation and then ask you to tell me your view about the justice of each of the decisions. A small firm has an apartment to rent. Three of its employees want the apartment. A choice has to be made. Now, what would be your view of the following decisions, using the same scale on this card.

The decision is made by judging the usefulness of each employee to the firm.

Note: Since 2006 variable is part of the international questionnaire. Data of ALL YEARS is now filed as V50234.

The decision is made following the rules that apply, whatever they may be.

Note: Since 2006 variable is part of the international questionnaire. Data of ALL YEARS is now filed as V50235.

The apartment is let to the employee willing to pay most.

Note: Since 2006 variable is part of the international questionnaire. Data of ALL YEARS is now filed as V50236.

The apartment is let to the employee with the largest family to support.

Note: Since 2006 variable is part of the international questionnaire. Data of ALL YEARS is now filed as V50237.

The decision is left to the three employees themselves, and whatever they may decide.

Note: Since 2006 variable is part of the international questionnaire. Data of ALL YEARS is now filed as V50238.

The decision about who gets the apartment is made by a lottery.

Note: Since 2006 variable is part of the international questionnaire. Data of ALL YEARS is now filed as V50239.
F86. Here is a third situation:
Some countries allow only a limited number of people to be naturalized each year. It is therefore necessary to treat every case on its individual merit before deciding whether a person should be naturalized. Imagine three people coming to see the officer at the bureau of naturalization wishing to become naturalized. It is equally important for each one of the three to become citizen of that state. The officer at the bureau can, however, only give the citizenship to one of the three people. What should he do? Now, what would be your view on each one of the following decisions, using the scale on this card.

The citizenship is awarded to the person whose work is most useful to society.

1 Code of the international list of the ‘Berufsstellung’ (See Core-Section for details)
3 The German list of ‘Berufsstellungen’ referring to farmers is transformed proportionally of farmer into the international list of ‘Berufsstellungen’. The criteria of transformation is the type of farmer (e.g. small, medium, large etc.), and not the measured size of the farm-area. (For direct comparison of the size of the farm-area: 1 hectare=2.471 acres.)
4 Respondents who work with no other employees (Code ’0’ in v35/v47) were classified with ’20’, all others ’21’.
5 Respondents who work with no other employees (Code ’0’ in v35/v47) were classified with ’30’, all others ’31’.

Appendix D. Description of Weight Variables

The survey institute provided a weight variable for the data set (V2139). This weight variable accomplishes two things: it corrects for the selection bias due to household size (respondents within large households have a smaller chance of being selected than respondents from small households) and it corrects for distribution skewness produced by refusals and other non-neutral reasons for not completing an interview. For this latter correction the weight construction uses an iterative proportional fitting procedure by which observed combinations of respondent attributes are fitted to tables of combined attributes of other large data sets, e.g. census data.

Based on census data of 1995 (December 31, 1995) the following variables were employed in the fitting procedure: länder, community size, and respondent’s sex and age. Based on the East's six länder and the West's 11 (counting West and East Berlin as two separate länder), on five classes of community size and on five age groups, the Western weight matrix contains 223 and the Eastern matrix 122 cells.

After the 1996 data set had been produced an alternative weight variable was created that would be applicable to both the 1991 and the 1996 surveys. It should be noted that in 1991 a different survey institute (infas, Bonn) was involved. This meant that statisticians of both institutes had possibly used different fitting procedures and different break-down categories for the tables. Another problem was that it could not be reconstructed whether in 1991 a table of all possible combinations of attributes was used for an iterative simultaneous fit, considering all possible interactions, or whether independent runs for some of the attributes were made. Finally, in working with the data from the two different years consideration had to be given to the fact that in 1991 the East had been overrepresented by about 1.5, whereas as in 1996 the overrepresentation was 2.5.

Joining the 1991 and 1996 data sets, therefore, a new weighting variable for the East and the West was constructed (V2145), also based on iterative proportional fitting involving länder, community sizes, sex, and age. Community size and länder were estimated separately, however, because of not available tables for very small communities as a consequence of German data protection laws.

In addition a weight variable V2147 was constructed reflecting the actual distribution of cases in 1991/1996 and East/West which should be used when comparing East and West Germany across the two time points of measurements.
