ISSP Study Description Form

Please use this form for reporting on Module 2006 and later!

Study title: „Rahvus, sallivus ja võrdne kohtlemine Eestis 2013“
[Nationality, tolerance, and equal treatment in Estonia 2013“]
Fieldwork dates: May-July 2013
Principal investigators: Triin Roosalu, Maaris Raudsepp, Margarita Kazjulja, Kadri Täht
from Tallinn University, Institute of International and Social Studies
Sample type: Probability sample, address-based sampling
Fieldwork institute: Turu-uuringute AS
Fieldwork methods: Face-to-face/self-administered
N. of respondents: number of respondents in the final ISSP file: 1009

<i>Details about issued sample:</i> Please follow the standards laid down in AAPOR/WAPOR, Standard Definitions: http://www.aapor.org/uploads/standarddefs_4.pdf . The numbers in the parentheses are those used in Tables 2 and 3 of Standard Definitions.	1. Total number of starting or issued names/addresses (gross sample size) *	4384
	2. Interviews (1.0)	1013
	3. Eligible, Non-Interview A. Refusal/Break-off (2.10) B. Non-Contact (2.20) C. Other i. Language Problems (2.33) ii. Miscellaneous Other (2.31, 2.32, 2.35)	647 (eligible member refused) 36 (eligible member not at home)
	3. Unknown Eligibility, Non-Interview (3.0)	2117 (no-one at home) + 235 (refused contact)
	4. Not Eligible A. Not a Residence (4.50) B. Vacant Residence (4.60) C. No Eligible Respondent (4.70) D. Other (4.10,4.90)	340

* When new sample units are added during the field period via a new dwelling units list or other standard updating procedure, these additional issued units are added to the starting number of units to make up the total gross sample size. Also, when substitution is used, the total must include the originally drawn cases plus all substitute cases. See AAPOR/WAPOR Standard Definitions, pp. 9-10 for further clarification.

Language(s): Estonian, Russian
Weight present: yes
Weighting procedure: Weighting was performed based on the national population census 2011 data and weights are added for gender, age, ethnicity, urban/rural, and regions.
Multilevel weighting was performed, considering all the pre-defined subgroups. For each of the structural subgroup (such as men aged 15-20) the weights within the group were calculated following the equation

2015-01-19

$$kg = \frac{X}{Y}$$

where

kg = weight of this group

X = expected number of respondents in the group

Y = actual (weighted) number of respondents in the group

Within each group the weight of each respondent is corrected individually, following the equation:

$$k = k * kg$$

The procedure will start when for every respondent $k=1$ and it is repeated by groups (and within each group by respondents) until within each group the difference between X and Y is close to zero ($< 0.00\%$).

*Known systematic
