Acknowledgement of Assistance

All manuscripts utilizing data made available through the "Zentralarchiv fuer empirische Sozialforschung" should acknowledge that fact as well as identify the original collectors of the data. We kindly ask all users to follow some adaptation of the following statement:

The data utilized in this (publication) were documented and made available by the ZENTRALARCHIV FUER EMPIRISCHE SOZIALFORSCHUNG, KOELN. The data for the 'ISSP' were collected by independent institutions in each country (see: principal investigators in the study-description-schemes for each participating country). Neither the original collectors nor the ZENTRALARCHIV bear any responsibility for the analyses or interpretation presented here

In order to provide funding agencies with essential information about the use of archival resources, and to facilitate the exchange of information about research activities based on the ZENTRALARCHIV's holdings, each user is expected to send two copies of each completed manuscript to the ZENTRALARCHIV.

Please note

All marginals in this documentation are calculated from

unweighted data

Please consider also that - especially in the section of the background variables - the same code-values do not always have the same meaning for each country. The differences are documented in this codebook.

An Introduction to the ISSP

The International Social Survey Programme

The ISSP is a continuing annual programme of cross-national collaboration on surveys covering topics important for social science research. It brings together preexisting social science projects and coordinates research goals, thereby adding a cross-national, cross-cultural perspective to the individual national studies. Twenty-nine countries are members of the ISSP.

It started late in 1983 when SCPR, London, secured funds from the Nuffield Foundation to hold meetings to further international collaboration between four existing surveys - the General Social Survey, conducted by NORC in the USA, the British Social Attitudes Survey, conducted by SCPR in Great Britain, the Allgemeine Bevölkerungsumfrage der Sozialwissenschaften, conducted by ZUMA in West Germany and the National Social Science Survey, conducted by ANU in Australia. Prior to this, NORC and ZUMA had been collaborating bilaterally since 1982 on a common set of questions.

The four founding members agreed to (1) jointly develop modules dealing with important areas of social science, (2) field the modules as a fifteen-minute supplement to the regular national surveys (or a special survey if necessary), (3) include an extensive common core of background variables and (4) make the data available to the social science community as soon as possible.

Each research organisation funds all of its own costs. There are no central funds. The merging of the data into a cross-national data set is performed by the Zentralarchiv für Empirische Sozialforschung, University of Cologne.

Since 1984, the ISSP has grown to more than 30 nations: the founding four - Australia, Germany, Great Britain and the United States - plus Austria, Bangladesh, Bulgaria, Canada, Chile, Cyprus, the Czech Republic, Denmark, France, Hungary, Israel, Ireland, Italy, Japan, Latvia, the Netherlands, New Zealand, Norway, the Philippines, Poland, Portugal, Russia, the Slovakian Republic, Slovenia, Spain, Sweden and Switzerland. New members are Brazil, South Africa and Venezuela.

The annual topics for the ISSP are developed over several years by a sub-committee and are pre-tested in various countries. The annual plenary meeting of the ISSP then adopts the final questionnaire. ISSP questions need to be relevant to all countries and expressed in an equivalent manner in all languages. The questionnaire is originally drafted in British English and then translated into other languages.

The ISSP marks several new departures in the area of cross-national research. First, the collaboration between organisations is not ad hoc or intermittent, but routine and continual. Second, while necessarily more circumscribed than collaboration dedicated solely to cross-national research on a single topic, the ISSP makes cross-national research a basic part of the national research agenda of each participating country. Third, by combining a cross-time with a cross-national perspective, two powerful research designs are being used to study societal processes.

ISSP Modules 1985 - 2000

ISSP 1985	Role of Government I	ZA No. 1490
ISSP 1986	Social Networks and Support Systems	ZA No. 1620
ISSP 1987	Social Inequality I	ZA No. 1680
ISSP 1988	Family and Changing Gender Roles I	ZA No. 1700

Spain	E
Sweden	S
Switzerland	CH
USA	USA

Study Description: Austria

Study title: Religion

Fieldwork dates: June – July, 1999

Principal investigators: Dr. Franz Höllinger, Prof. Max Haller, Mag. Kathrin Scholz

Sample type: Stratified multi-stage clustered random sampling of Austrian respondents aged 18 years and older

Fieldwork institute: IFES, Wien

Fieldwork methods: Face-to-face interviews

Sample size: 1002

Response rates:

1728	A - Total issued (total sample)
77	B - Ineligible (address vacant, wrong ages,...)
1651	C - (= A - B) Total eligible (in scope sample)
1002	D - Total ISSP questionnaires received
652	E - (= C - D; = F + G + H) Total non-response
285	F - Refusals (refusing to take part)
291	G - Non-contact (never contacted)
76	H - Other non-response

Language: German

Weighted: Yes

Weighting procedure: Weighting criteria:

Bundesland
Size of community
Sex
Age
Employment status / Professional status

Deviations from ISSP-questionnaire: DEGREE: 4 ("abgeschlossene Lehre" – 3 or "berufsbildende Schule" – 4)

WRKGGOVT: 1 (government or public owned firm)

CLASS: 2 = lower middle class

A_PRTY: 3 = FPOE (right-liberal)

4 = GRUENE (Green)

5 = LIF (liberal)

ATTEND: 2 (1 – 3 times per month)

National Population Characteristics: Austria

Not in labour force		43.9%	43.5%

Study Description: Canada

Study title: ISSP Religion

Fieldwork dates: December, 1 1999 – March 1, 2000

Principal investigators: Carleton University Survey Centre, Ottawa

Sample type: Stratified Random Sample

A random sample of 5.000 Canadian residents was purchased from Info Canada, which is based on residential phone listings. The mailout was done in two separate mailings with one reminder notice. The first mailing was sent to a random selection of 2.500 from the provided list and the second of 2.000 was sent out six weeks later. A reminder notice was sent two weeks after the initial mailouts.

Fieldwork method: Self-completion Mail

Context of ISSP questionnaire: With the 1999 Social Inequality Survey

Sample size: 974

Response rates:

4500	A - Total issued (total sample)
1150	B – Ineligible (address vacant, wrong ages,...)
3350	C - (= A - B) Total eligible (in scope sample)
974	D - Total ISSP questionnaires received
2366	E - (= C - D; = F + G + H) Total non-response
	F - Refusals (refusing to take part)
	G - Non-contact (never contacted)
	H - Other non-response

Language: English and French

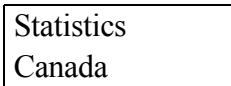

Weighted: Yes

Weighting procedure: The weights are based on the joint distribution of sex and province as established in the large sample microdata file that is usually used to represent the Canadian mid-census of 1996.

1. If a case in the ISSP file was missing one or both of the weighting variables, it was given a weight of one rather than excluding it from weighted analysis.
2. Minor proportioning factors were included in the weights to ensure that the number of cases in the weighted file is the same as the number of cases in the unweighted file.

Generally speaking, the weights should be used in arriving at estimates for any national analysis.

*Deviations from ISSP- V46 and Variable ‘size of community’ are missing.
questionnaire:*

National Population Characteristics: Canada**SEX**

Male	49.3 %
Female	50.7 %

AGE

18 – 24	13.3 %
25 – 34	23.8 %
35 – 44	21.6 %
45 – 54	14.7 %
55 – 64	11.8 %
65 +	14.8 %

TOTAL YEARS OF SCHOOLING (population 18+)

1 – 9 years	20.5 %

12 – 13 years	30.1 %
14 + years	30.1 %

Study Description: Chile

Study title: First National Public Opinion Study 1998: Religion

Fieldwork dates: June 8th – 29th, 1998

Principal investigators: Carla Lehmann and Paulina Valenzuela, Centro de Estudios Públicos

Sample type: Probability three-stage cluster sample of Chilean population 18 years and older. Stratification factor was region.

Regional structure of Chilean population:

<u>Region</u>	<u>% Population 15 years+</u>
I. Tarapacá	2.6 %
II. Antofagasta	3.0 %
III. Atacama	1.7 %
IV. Coquimbo	3.7 %
V. Valparaíso	10.5 %
VI. Libertador Bdo. O'Higgins	5.2 %
VII. Maule	6.1 %
VIII. Bío Bío	12.7 %
IX. La Araucanía	5.7 %
X. Los Lagos	7.0 %
XI. Aisén	0.6 %
XII. Magallanes and Antarctic	1.1 %
XIII. Metropolitan (Santiago)	40.1 %

Source: Population Estimates. June 30th 1995. National Institute of Statistics.

Note: The population of 15 years+ in 1995 is considered, as this group will be 18 years+ in 1998.

Sampling Stages

First stage: The first stage of the sampling process sets the number of completed interviews per cluster at 5; a cluster is defined as a block (manzana – used in urban areas) or populated entity (entidad – used in rural areas). The application of 5 interviews per cluster to the total number of interviews targeted in the sample (1,505) yields 301 primary sampling units (PSUs) to be identified in the first stage of sample selection.

The PSUs are proportionally distributed throughout the regions of the country, taking into account the region's contribution to population (both urban and rural).

Number of Clusters per Region:

<u>Region</u>	<u>Urban</u>	<u>Rural</u>	<u>Total</u>
I. Tarapacá	7	1	8
II. Antofagasta	9	0	9
III. Atacama	4	1	5
IV. Coquimbo	8	3	11
V. Valparaíso	29	3	32
VI. Libertador Bdo. O'Higgins	11	5	16
VII. Maule	11	7	18
VIII. Bío Bío	30	8	38
IX. La Araucanía	11	6	17
X. Los Lagos	13	8	21
XI. Aisén	1	1	2
XII. Magallanes and Antarctic	3	0	3
XIII. Metropolitan (Santiago)	117	4	121
TOTAL	252	47	301

Using the most reliable digital information on hand, i.e. 1991 pre-census data, a cumulative listing of population by province (provincia), borough (comuna), district (distrito), zone (zona) and block (manzana) was prepared in the urban case; by province, borough, district, locality (localidad) and entity (entidad) in the rural case (geographically arranged).

In both the rural and the urban case a fixed interval is set for each region by dividing the total population for that region by the number of PSUs assigned to it. Within each region, a purely random selection process is followed, such that each individual (as represented by population statistics) has a calculable probability of being selected as the reference point for a PSU.

This is carried out through a computerised, random, proportionate-to-population process to select blocks in the urban areas and entities in the rural areas. A computer program is developed to select the 252 urban blocks and the 49 rural entities for the sample. All the blocks and entities are identified by number and located on a census map.

Second Stage:

The second stage in the sampling process is to select households (dwellings) within PSUs. Selection rules for households within chosen blocks and entities are provided to interviewers, to enable them to select households randomly within each cluster. After taking a census of each selected block and entity, a random walk or systematic sampling procedure is followed, whereby every n^{th} dwelling is included in the sample until a total of 5 households are identified. (The total number of numbered dwellings was divided by 5 (the number of interviews per cluster); this gave an interval length, such that if it was $43/5 = 8$, starting from the point randomly pre-assigned as the first dwelling, the interviewers went to dwelling $N^{1/4} 9$, then to $N^{1/4} 17$, and so on until 5 interviews were completed).

Third Stage:

The third stage is to select, within each household, a person to be interviewed. Interviewers are instructed to apply a random selection process (random number table) to identify the person to be interviewed.

Other Important Aspects in the CEP Sample Design:

In the second and third stages, the interviewer has to make three attempts on three different days to try to reach the original house or person to be interviewed. In these attempts the interviewer must deliver a letter signed by the CEP director explaining the nature of CEP and the aims of the study.

If the original household or person finally cannot be contacted, they are replaced. The rules for replacement are as follows:

A. Blocks and Entities

The replacement of a block or entity will occur in the following situations:

- Vacant lots that could not be detected prior to sample selection
- Areas which are almost inaccessible
- Entities and/or blocks intended basically for commercial use
- Parks or stadiums
- Areas belonging to the armed forces

Blocks and entities are randomly replaced: the original selection is replaced with the one whose identification number comes immediately before that of the original. If this is not successful, the block/entity with the identification number immediately following the original selection is taken

B. Households

Failed dwellings are accounted for as follows:
by outright refusal to receive the interviewer, even having received the letter from the CEP director.

- by the absence of occupants at a house after three visits on three different days (vacations or other reasons).
- the house is unoccupied.
- access denied (condominiums or buildings with security guards)
- other special cases (foreigners with whom it is impossible to communicate, etc.)

Each failed dwelling is randomly replaced by another one from the same block/entity. The replacement interval is defined as $(k-1)$, where k = the original selection interval. Starting from the last house originally selected, the interval $(k-1)$ is added to select the first replacement house, and so on. The fieldwork treatment of replacement houses as regards the number of repeat visits is the same as for the original houses.

C. Individuals

Individuals are replaced under the following circumstances:

- when the person selected refuses to answer the questionnaire, even after receiving the letter from the CEP director.
- when the person selected cannot be located after three attempts on three different days, or will be away for a period longer than the duration of fieldwork.
- the person offers to respond on a date long after the closing date of the field work.
- individuals with serious physical or psychological handicaps which prevent them from responding (mentally handicapped, deaf and dumb, etc.)
- the individual is physically and psychologically fit, but is ill, in bed and does not want, or is unable to respond to the survey.
- the selected individual is a foreigner with less than 5 years in the country (unable to vote).
- the person starts to answer but he/she does not want to finish the interview.
- other specific cases.

In replacing individuals, the dwelling is replaced according to the rules explained above, and an individual from the new household is chosen by a random selection process.

It is important to bear in mind that, by using these replacement rules, the sample size achieved is always very close to 1505 (issued sample size).

Fieldwork methods: Face-to-face interview

Context of ISSP questionnaire:

The religion module of the ISSP was carried out in conjunction with 18 questions relating to Chilean political, economic and social attitudes and tendencies, as well as two additional questions on the topic of religion.

The questionnaire was structured as follows: firstly, the 18 questions mentioned above, then the complete ISSP module, followed by the two additional questions on religion and, finally, demographic variables.

Sample size:

The sample size finally achieved was 1,503 interviews.

2 interviews were lost:

- One in the Region III, from the borough of Vallenar: the inhabitants were away in the mountains. The household could not be replaced as there were no dwellings nearby and the field work was close to conclusion (June 27th)
- The other was in Region IX, borough of Temuco: the inhabitants were not at home after 5 visits; the final visit was on June 29th, by which time it was too late to make a replacement.

Response rates:

1505	A - Total issued (total sample)
0	B - Ineligible (address vacant, wrong ages,...)
1505	C - (= A - B) Total eligible (in scope sample)
1503	D - Total ISSP questionnaires received
2	E - (= C - D; = F + G + H) Total non-response
0	F - Refusals (refusing to take part)
0	G - Non-contact (never contacted)
0	H - Other non-response

However, for the type of sampling used by CEP, these data are not real. CEP uses the following method for calculating the response rate.

Let A = number of original interviews achieved (not replaced) = 1362

Let B = number of non-original interviews achieved (replaced) = 141

Let C = A+B = number of questionnaires received (total sample) = 1503

$$B = D1 + E1 + F1 + D2 + E2 + G + F2 = 141$$

where :

D1 = number of interviews replaced due rejection of household = 40

E1 = number of interviews replaced due to no contact in house (empty house + nobody comes to the door) = 35

F1 = number of interviews replaced for other household reasons = 1

D2 = number of interviews replaced due to individual rejection = 32

E2 = number of interviews replaced due to failure to make contact with selected individual = 28

G = number of interviews replaced due to physical or psychological impediment of selected individual = 4

F2 = number of interviews replaced for other individual reasons = 1

No-response rate = number of non-original interviews achieved

(replaced)/ total number of interviews (replaced + original)

$$= B / C = 141 / 1503 = 9.4\%$$

Language: Spanish

Weighting procedure: A weighting procedure is applied in order to correct for distortions in the representativeness of the sample as regards three variables of interest: Gender, Age, (grouped in five categories: 18-24 years, 25-34, 35-44, 45-54, 55 or older) and Urbanity (classification of place of residence as urban or rural). This makes it possible to obtain a sample with characteristics similar to those of the population. The weights are constructed by calculating the quotient between the expected distribution and that observed in the cross between Urbanity, Gender and Age. The expected distribution is obtained from population

projections provided by the National Institute of Statistics. The result of the weighting slightly corrects for problems of under- and over-representation among certain specific groups of the population.

Known Systematic Properties in Sample: The sample design described above has been used in the last 8 surveys and has given good results, so it can be stated that it does not have properties that might be causing some type of bias in the results.

Deviations from ISSP questionnaire: The questionnaire was translated as closely as possible from English to Spanish, maintaining the meaning and significance of each sentence and word.

Some general comments:

- The possible answer “Can’t choose” was translated into Spanish as “No sabe o No contesta” (Don’t know or No reply).
- In questions 24, 25 and 26 two religions were added:
- Code Nº 9: Mormon
- Code Nº 10: Jehovah’s Witness
- In the same questions as above, those who answered “Protestant” were asked “What specific denomination?” This was asked in a closed way, including nine different Protestant churches plus Code Nº 10: Other.
- In question 27 the following was added as Code Nº 9 : Not married and not living with anyone.
- In question 27, those who answered “Protestant” were asked “What specific denomination?” This was asked in a closed way, including nine different Protestant churches plus Code Nº 10: Other
- In questions 28, 29, 30, 31 and 32 Code Nº 99 was added: No reply.
- In questions INCOME and RINCOME, incomes were measured like monthly net-income.

Study Description: Czech Republic

Study title: ISSP 1998 Religion II, Czech Republic

Fieldwork dates: 18th June – 27th July 1999

Principal investigators: Research team on social stratification of the Institute of Sociology, Academy of Sciences of the Czech Republic, Prague

Sample type: Three-stage random stratified sample. Stratification factor was region, the basic sample unit was household.

Stages:

- Random sample of 150 election districts.
- Preparation of the list of all households in each district. Random selection of households in each district.
- Random selection of respondent (Kish grid).

Fieldwork methods: Face-to-face interview

Context of ISSP questionnaire: Stand-alone study. Country specific questions attached to the end of the module.

Sample size: 1223

Response rates:

3120	A - Total issued (total sample)
33	B - Ineligible (address vacant, wrong ages,...)
3087	C - (= A - B) Total eligible (in scope sample)
1223	D - Total ISSP questionnaires received
1864	E - (= C - D; = F + G + H) Total non-response
1674	F - Refusals (refusing to take part)
182	G - Non-contact (never contacted)
8	H - Other non-response

Language: Czech

Weighted: Yes

Weighting procedure: Total weight is constructed from:

- design weight based on proportion of household sizes, and
- post-stratification weights based on sex (male-female), education (primary-vocational-secondary-university), and distribution of age (18-29, 30-44, 45-59, 60+)

The weights were prepared on the base of Microcensus 1996.

Microcensus surveys are income surveys based on 1-2 % sample of households which are regularly repeated every 3-5 years since 1958. The

Microcensus 1996 was conducted by the Czech Statistical Office on a 1 % random sample of households in March 1997.

Known systematic properties:

- In selected households the probability of selection of respondent was 1 / number of adult household members. The bias resulting from the sampling design is corrected using the design weight.
- Due to a low response rate respondents with lower education and men are significantly underrepresented. This problem is also corrected by weighting.

Deviations from ISSP-questionnaire

- V68, V69, V72, V79: These optional questions were not included into the Czech questionnaire.
- DEGREE: Category INCOMPLETE SECONDARY EDUCATION includes lower vocational training
- V51, V53, V55, V57, RELIG: Include Czech specific categories of religious denomination: 61 'Czech Bretheren's Evangelical Church, 63 'Czechoslovak Hussite'
- Country specific variables
- Incomes
- RINCOME: Total average net income of respondent per month is in CZK. It includes incomes from main job or business, incomes from additional gainful activities or property, rents, social incomes as are unemployment benefits, maternal benefits, allowances etc. and it does not include child allowances and state compensatory benefits for children.
- INCOME: Total average net income of household per month is in CZK and includes incomes and rents of all household members and all social benefits, allowances and complementary incomes.

Study Description: Denmark

Study title: ISSP 1998 Religion

Fieldwork dates:

Principal investigators: Prof. Jørgen Goul Andersen (Director of the Danish ISSP programme), Prof. Johannes Andersen, Prof. Lars Torpe, Mette Tobiasen (all Ålborg University); Prof. Ole Borre, Prof. Lise Togeby (both University of Århus); Prof. Poul Erik Mouritzen, Ulrik Kjaer (both University of Odense); Prof. Hans Jørgen Nielsen, Prof. Bjarne Hjorth Andersen (both Copenhagen University).

Sample type: Sampling from a registre of the population is not allowed in Denmark. A description of the sampling procedure is enclosed. The description is the standard enclosure for the face-to-face in-home omnibus on which the data are collected. The universe of the omnibus is persons 13 + years. For the ISSP survey, persons 13-17 years of age were screened out.

Fieldwork methods: ACNielsen AIM's sampling frame consists of 1400 districts which together are fully representative of Denmark. For each wave of the face-to-face omnibus 60 districts are drawn which make up a sample representative of the Danish population.

The universe of the face-to-face omnibus consists of about 4.5 million individuals aged 13 years and over living in about 2.4 million private households.

Stratification by geographical region and urbanisation is employed in the section of districts for any given omnibus wave. More specifically, the districts selected are distributed on six geographical regions and six degrees of urbanisation. Furthermore, types of dwelling and size of towns are also taken into account in the selection of districts from the individual geographical regions.

The interviewing districts making up the sampling frame have been selected from statistics comprising the total Danish population aged 13 years and over.

For each omnibus wave districts are drawn by (systematic) random sampling from the individual geographical-urbanisational strata. The districts thus selected are the actual interviewing districts. Interviewers are given a list of all addresses in the districts to which they are assigned.

In households with three or fewer members we attempt to conduct one interview whereas two interviews are conducted in households with four or more members. The individual(s) selected in any given household is/ are the individual(s) aged 13 years or over at the time of the interview whose birthday(s) is/ are the next to come round.

Sample size: 1114

Response rates:

The basic sample is in reality a sample of "front doors" rather than one of persons. Little or nothing is known about the families living behind the front doors where we don't succeed in getting an interview. Response rates therefore can only be estimated. The basis for the estimation is total no. of households contacted: no. of households where an interview is obtained; but this rough estimate is refined through taking into account a number of factors such as the expected distribution of no. of persons in the households that do not give an interview, and a correction factor for addresses that have not been visited the prescribed 3 times before abandoned. The estimated rate of completion is 64 %. On "font door" basis, the non-response is divided 44 %/ 56 % on refusals and not at home.

Study Description: Great Britain

Study title: British Social Attitudes 1998

Fieldwork dates: April to August 1998

Principal investigators: Roger Jowell, Alison Park, Katarina Thomson, Lindsey Jarvis, Catherine Bromley, Nina Stratford

Sample type: Stratified random probability. The sample is designed to be representative of adults aged 18 or over living in private accommodation in Great Britain. It was drawn from the postcode address file (PAF) which is a list of addresses compiled by the Post Office. The sample method involved a multi-stage design: first 83 postcode sectors were selected, with probability proportionate to the number of addresses in each sector. Thirty addresses were then selected in each sector by starting at a random point of the list of addresses for each sector and choosing each address at a fixed interval. Finally, when interviewers called at the addresses, they selected one dwelling unit and one respondent at the selected dwelling unit using a Kish grid.

Fieldwork methods: Self-completion supplement given to respondents following the face-to-face interview (on which the classification question were asked). The supplement was either collected by the interviewer or posted back to the office.

Context of ISSP-questionnaire National Centre for Social Research's (formerly SCPR) *British Social Attitudes* survey – Version B of the self-completion supplement (there were three versions in total).

Sample size: 805

Response rates:

2000	A - Total issued (total sample)
221	B - Ineligible (address vacant, wrong ages,...)
1779	C - (= A - B) Total eligible (in scope sample)
805	D - Total ISSP questionnaires received
748	E - (= C - D; = F + G + H) Total non-response
535	F - Refusals (refusing to take part)
226	self-completion
94	G - Non-contact (never contacted)
119	H - Other non-response

Language: English

Weighted: Yes

Weighting procedure: Data were weighted to take account of the fact that not all units covered in the survey had the same probability of selection. The weighting applied reflected the relative selection probabilities of the individual at the three main stages of selection: address; household; and individual. The average weight supplied was 1.00.

65+	20.7 %	24.0 %

Study Description: Hungary

Study title: ISSP 1998 Religion Module

Fieldwork dates: 11th – 23rd November, 1998

Principal investigators: TARKI RT - Social Research Center (Peter Robert, Senior Researcher)
Prof. Andrew Greeley (NORC, University of Chicago)

Sample type: Three-stage random stratified sample of hungarian population aged 18 or older.

First stage: Selection of 9 regions and selection of settlements within the regions. Localities were chosen by taking into consideration the size of population.

Second stage: Defining the number of households in the settlement based on the size of population. Selection of households within the localities using the method of 'random walk'.

Third stage: Selection of respondent within the household, based on the number of adults and number of adult men, using Leslie Kish - key method.

If the selected respondent was not present, the interviewer had to make two other attempts to contact him/her. In case of failure, household was substituted by taking the next household living in the right neighboring house/apartment. The third stage of the selection was repeated.

Fieldwork methods: Standardized face-to-face interview.

Context of ISSP-questionnaire: The 1998 ISSP Religion module was the only section in the survey. The questionnaire included the ISSP optional questions and the ISSP background variables.

Sample size: 1000

Response rates:

1941	A - Total issued (total sample)
25	B - Ineligible (address vacant, wrong ages,...)
1916	C - (= A - B) Total eligible (in scope sample)
1000	D - Total ISSP questionnaires received
916	E - (= C - D; = F + G + H) Total non-response
400	F - Refusals (refusing to take part)
-	G - Non-contact (never contacted)
516	H - Other non-response

Language: Hungarian

Weighted: Yes

Weighting procedure: In order to correct the sampling errors we computed a weighting variable taking into account the type of residence, sex, age and highest educational level. The weight of each case was computed as WEIGHT=(F/f)*(n/N), where N=7,904,813 (respondents above the age of 18 in the 1996 Microcensus data), n=1000, F= frequency of the population category in the Microcensus the case belongs to, f= the parallel frequency in the 1998 ISSP Religion module of TARKI.

National Population Characteristics: Hungary

Study Description: Ireland

Study title: Religion

Fieldwork dates: May to June 1998

Principal investigators: Conor Ward

Sample type: Two-stage Random (Probability) Sample from a frame of the national population over 18 years of age – no upper limit, using the register of Voters.

Stage 1 – 63 areas (District Electoral Divisions),

Stage 2 – 30 Named Individuals in 57 areas, 29 Named Individuals in 6 areas. The sample design is “epsem” i.e. each element (elector) in the population has an equal probability of selection.

Context of ISSP: Dedicated survey

Fieldwork methods: Personal (face to face) interview

Sample size: 1010 completed interviews

Response rates:

1884	A - Total issued (total sample)
209	B - Ineligible (address vacant, wrong ages,...)
1675	C - (= A - B) Total eligible (in scope sample)
1010	D - Total ISSP questionnaires received
665	E - (= C - D; = F + G + H) Total non-response
328	F - Refusals (refusing to take part)
265	G - Non-contact (never contacted)
72	H - Other non-response

Language: English

Weighted: Yes

Weighting procedure: The weights data provided were derived using standard weighting procedures. Population controls were derived from bi-annual Labour Force Survey and are based on (1) Gender 2 categories (Male and Female) (2) age cohort 10 categories (18-24,25-29,30-34,35-39,40-44,45-49,50-54,55-59,60-64,65+) (3) marital status 4 categories (Single, Married, Separated and Divorced, Widowed)

Note re age: These are the standard categories in the sampling and are not used in coding data)

Study Description: Japan

Study title: Japanese Consciousness concerning Religion

Fieldwork dates: 12th – 18th November, 1998

Principal investigators: Onodera, Noriko

Sample type: We used a two-stage stratified random sample of Japanese 16 or older. First, urban and rural areas are divided into a number of groups (strata) based on similarities in local features and industrial structures. From each of those groups, streets and village-sections are again grouped together to form sampling units. From among such sampling units, 150 survey spots are selected at random. Then, from the Basic Resident Registers for these spots, 12 sample individuals aged 16 or over are selected according to a fixed random number.

Fieldwork methods: Self completion (Dropping off and later picking up questionnaires)

Sample size: 1368

Response rates:

1800	A - Total issued (total sample) (= B + C)
114	B - Ineligible (address vacant, wrong ages,...)
1701	C - (= D + E) Total eligible (in scope sample)
1368	D - Total ISSP questionnaires received

Study Description: Latvia

Study title: Religion

Fieldwork dates: 17th – 31st August, 1998

Principal investigators: Aivars Tabuns, Ilze Koroleva, Institute of Philosophy and Sociology, University of Latvia, Riga

Sample type: Multi-stage stratified sampling of permanent residents of Latvia aged 18 – 85.

Stage 1: Stratification is performed in accordance with administrative territorial division of the country and by type of settlement (urban and rural). The six administrative districts of the capital Riga and the 6 largest cities (Daugavpils, Jelgava, Jūrmala, Liepāja, Rēzekne and Ventspils) form 12 separate strata. The population residing in the remaining territory are divided into 52 strata depending from their place of residence – rural or urban territory and belonging to one of the 26 districts of Latvia.

Stage 2: One or more primary sampling units is randomly selected within each stratum. 82 – 100 sampling points are included into the sample. 6 districts of Riga and 6 major cities are subdivided in typical micro-districts (on account of the various types of housing, disposition from city centre). Streets are selected randomly from the list of streets in appropriate order. In towns with more than one post office, post offices are randomly selected out of the list of post offices. The rural points are randomly selected out of the list of all settlements in the sampled parishes (*pagasts*).

Stage 3: A household is selected within the already selected local points.

- The survey is carried out by random route sample. The route is selected randomly from an alphabetical list of all the streets in the locality.
- The sample is drawn from the population register. The survey is carried out by address sampling

Stage 4: Within a household, the interviewer interviews the householdmember whose birthday is nearest or selects the person using the Kish Table (only one method per survey). The interviewer has to return twice to a household if the potential respondent is absent during the first visit.

Fieldwork methods: Face-to-face interviews.
115 sample points.

Study Description: New Zealand

Study title: Religion: New Zealand

Fieldwork dates: 7th August – 31st October, 1998

Principal investigators: Professor Philip Gendall, Department of Marketing, Massey University, Palmerston North, New Zealand

Sample type: Systematic random sample from electoral rolls.
 The sample was selected from the 1996 New Zealand electoral rolls, which contain the names of all registered voters over the age of 18 years. New Zealand is divided into 65 electorates (60 general electorates and 5 Maori electorates) of approximately equal numerical size. A systematic random sample of approximately 28 names and addresses was selected from each electorate, giving a total sample of 1800 individuals.

The achieved sample is generally representative of the New Zealand population over 18 years of age, but it contains a slightly higher proportion of women than men in the population aged over 18 years. In addition, people under 30 are underrepresented in the sample, while those over 30 are overrepresented. However, these differences are unlikely to have a significant effect on the survey's results.

Fieldwork methods: Mail survey in four waves.

The questionnaire was administered by mail in four waves. The questionnaire together with a covering letter was sent to the 1800 selected participants on 7 August 1998. Three weeks later a reminder letter and another questionnaire were sent to non-respondents. A second reminder and another questionnaire were mailed to remaining non-respondents after a further three weeks, followed by a final reminder letter four weeks later. The survey was closed off on 30 October, 12 weeks after the initial mailing.

Context of ISSP-questionnaire: Dedicated survey, with ISSP questions preceding non-ISSP questions and demographics

Sample size: 1800

Response rates:

1800	A - Total issued (total sample) (= B + C)
262	B - Ineligible (address vacant, wrong ages,...)
1538	C - (=D + E) Total eligible (in scope sample)
998	D - Total ISSP questionnaires received
529	E - (=F + G) Total non-response
133	F – Refusals (refusing to take part)
-	G - Non-contact (never contacted)
398	H - Other non-response

The response rate achieved was $998/(1800-262) = 64,9\%$.

Study Description: Northern Ireland

Study title: The Northern Ireland Life and Times Survey

Fieldwork dates: October 5th 1998 and December 31th 1998

Principal investigators: Paula Devine, Lizanne Dowds - Centre for Social Research, Belfast, Northern Ireland

Sample type: Sampling design:
The survey was designed to yield a representative sample of men and women aged 18 and over living in Northern Ireland. The Postal Address File (PAF) was used as the sampling frame for the survey. The first stage in the sampling process was to stratify Northern Ireland into three geographic strata based on an amalgamation of Local Government Districts, namely Belfast, East of the Bann and West of the Bann. This was done to ensure the adequate representation of areas of lower population density and is standard practice in Northern Ireland Social surveys. Within each of the three strata, the sample size was set to reflect the proportion of the adult population resident there as at the 1991 census. Within each stratum addresses were selected on a simple random sample basis. At selected addresses, a KISH grid procedure was utilised to randomly select one individual to be the subject of the survey.

Each stratum was over sampled to provide reserve addresses. Interviewers were instructed to make a total of five calls, or have received a refusal or other information confirming that an interview would not be obtained, before being issued with reserve addresses. This was to ensure optimal response from the main sample.

Fieldwork institute: Interviewing was carried out by social survey interviewers employed by Research and Evaluation Services (RES). All fieldworkers attended a briefing session conducted jointly by RES' project management team, together with members of the NILT project team.

Fieldwork methods: All interviews were conducted in the respondent's home. Interviewers made up to a maximum of five calls before the person identified in the sample was deemed non-obtainable. The average length of time taken to complete interviews was 40 minutes. The self completion form was either completed and handed back to the interviewer at the time of the main interview, or the interviewer called back at a later stage to collect it.

Advance letter:

Households identified in the sample were sent an advance letter explaining the background to the survey, the method by which an individual respondent would be selected from the household and requesting co-operation with the project. The advance letter also confirmed that a donation of one pound would be made to Action Cancer on behalf of each respondent. A letter from Action Cancer was

also enclosed, confirming the arrangement between them and the research team, and referring to the positive uses to which such valuable donations would be put.

Context of ISSP questionnaire:

The Northern Ireland Life and Times Survey is a direct descendent of the Northern Ireland Social Attitudes Survey (NISA) which ran from 1989 to 1996. NISA was a sister survey to the British Social Attitudes Survey (BSA), and by running the same modules as BSA it provided a time-series of social attitudes allowing comparisons with Britain.

Against the background of the new political arrangements in Northern Ireland it was agreed that the new Northern Ireland Life and Times Survey would be better served by cutting its links with its British counterpart. NILT now carries on the tradition of a time-series of attitudes but has shifted the focus away from comparisons with Britain. It is largely Northern Ireland focused; it is social policy focused; and it is designed to be used by the wider public in Northern Ireland. Nonetheless, every year includes a substantial component which either continues an old NISA time-series, or replicates a BSA module.

Each year over 30 countries participate in the International Social Survey Programme (ISSP) in which the same module of questions is asked cross-nationally. Northern Ireland has also taken part in this exercise (via NISA) since 1989. The 1998 module covered ***Religious Observance*** and the 1999 ISSP will cover ***Social Inequality***.

The *Northern Ireland Life and Times Survey* involves 1800 face-to-face interviews with adults aged 18 or over. The main interview is carried out using computer assisted interviewing and the respondent is then asked to complete a self-completion form.

Not all modules are asked of the full 1800 adult sample. Where a smaller sample size is sufficient for a module the sample is 'split', such that half the respondents are asked those questions. For example the structure of the 1998 survey allowed half the sample to be asked the *Public Understanding of Science* module, while the other half were asked *Rights of the Child* module. For this reason, there are 812 respondents for this ISSP module.

Sample size: 812

Response rates:

A - Total issued (total sample)
B - Ineligible (address vacant, wrong ages,...)
C - (= A - B) Total eligible (in scope sample)
812 D - Total ISSP questionnaires received
E - (= C - D; = F + G + H) Total non-response
F - Refusals (refusing to take part)
G - Non-contact (never contacted)
H - Other non-response

Weighted: Yes

Weighting procedure: It is not possible, using the Postcode Address File, to select addresses with probability proportionate to the size of the household. To compensate for this potential source of bias, the data should be weighted prior to analysis. The weighting adjusts for the fact that individuals living in larger households had a lower chance of being included in the sample than individuals living in smaller households. The data are weighted in relation to the number of eligible adults at that address, derived from the details of household structure recorded by the interviewers. In order to retain the actual number of interviews, the weighted sample was scaled back to the originally achieved sample size.

Distribution of the scaled weight:

Number of adults 18 +	Weight	Number	%	Scaled weight
1	1	592	32.9	0.51
2	2	878	48.8	1.02
3	3	202	11.2	1.53
4	4	90	5.0	2.04
5	5	26	1.4	2.56
6	6	9	0.5	3.07

Study Description: Philippines

Study title: Religion

Fieldwork dates: October 28 – November 14, 1998

Principal investigators: Social Weather Stations

Sample type: Multi-stage probability sampling.

The entire Philippines is divided into four major study areas: National Capital Region (NCR which is totally urban), and the urban and rural areas of Luzon (outside of NCR), Visayas and Mindanao. The target sample size for each of the four major areas is 300 households (150 urban and 150 rural households).

Multi-stage probability sampling is used in selecting the respondents: For NCR, three stages and for the rest of the country, 5 stages.

For NCR's first stage, 60 precincts are distributed among the 17 NCR cities and municipalities in such a way that each city/municipality is assigned a number of precincts that is roughly proportional to its population size. An additional provision is that each municipality must receive at least one precinct. Precincts are then selected at random within each municipality with probability proportional to population size.

For the second stage, in each sample precinct map, interval sampling is used to draw 5 sample households: a starting street corner is drawn at random. The first sample household is randomly selected from the households nearest to the starting street corner. Subsequent sample households were chosen using a fixed interval of 6 households in between the sampled ones; i.e. every 7th household is sampled. In each sample household, the household head was asked questions which pertain to the entire household. If during the interview of the sample adult the household head was not available, questions for the household head were left blank, but the socio-demographic profile of the household is still obtained. However, it was required that there should be at least 3 households per precinct where the household head and the sample adult belong to the same household. So callbacks, if needed, were made to meet this requirement.

For the third stage, in each selected household, a respondent is randomly chosen among the household members who are 18 years of age and older, using a probability selection table. In selecting the probability respondent of a household, only male family members were pre-listed in the probability selection table of odd-numbered questionnaires; only female family members were pre-listed for even-numbered questionnaires. In cases where there was no qualified probability respondent of a given gender, the interval sampling of households would continue until five sample respondents were identified.

For the rest of the country, the provinces serve as the common first stage unit. Using updated provincial population figures, 10 provinces in Balance Luzon, and 5 each in Visayas and Mindanao are chosen

without replacement and with probability proportional to sizes. The municipalities of the sample provinces serve as the second stage units. Within each study area, fifteen (15) municipalities are selected from among the sample provinces in such a way that each province is assigned a number of municipalities roughly proportional to its population size. However, each sample province must receive at least one municipality. Sample municipalities are then selected from within each sample province with probability proportional to population size, without replacement.

The third stage involves getting sample spots from urban and rural areas. Once the sample municipalities have been selected, 60 spots are distributed among the sample municipalities in such a way that each municipality is assigned a number of spots roughly proportional to its population. However, each sample municipality must receive at least one spot.

If based on the National Statistics Office categorization, the chosen sample municipality/city is 100% urban in 1990 (latest), then sample precincts are systematically drawn from this municipality/city. Otherwise, sample barangays within each sample municipality are selected with probability proportional to population size without replacement.

In the effort to update the urban-rural classification of barangays, the survey adopted a classification scheme slightly different from the official NSO definition. The interviewers were instructed to ascertain whether the barangay has the following:

- A) Street patterns, i.e. network of streets in either parallel or right angle orientation
- B) At least 6 establishments (commercial, manufacturing, recreational and/or personal services)
- C) Any of the following:
 - 1a. town/barangay hall
 - 1b. church/chapel
 - 2a. public plaza/park
 - 2b. cemetery
 - 3. public market
 - 4. public building like school, hospital, health center or library

If the barangay has at least two of the categories listed as A, B or C, then the barangay is classified as urban. Otherwise, the barangay is categorized as rural.

For the fourth stage, within each sample spot, 5 households were established by systematic sampling. In sample (urban) precincts, a random corner was identified; a random start generated; and the interval was seven. In ascertained urban barangays (with no precinct maps), the designated starting point was the same as in rural barangays - it was a school, the barangay captain's house, a church/chapel or a barangay/municipal hall. The sampling interval for urban barangays was seven, while for rural barangays it was two.

The household head in these sample households is asked questions pertaining to the entire household. If during the interview of the sample adult, the household head is not available, after a number of valid callbacks, questions for the household head were left blank.

However, it was required that there should be at least 3 households per sample spot where the sample household head and the sample adult belong to the same household. So callbacks, if needed, were made to meet that requirement.

For the fifth and final stage, a respondent is randomly chosen among the voting-age household members in each selected household using a probability respondent selection table. Given these proportions, the sampling breakdown is summarized as follows:

Urban

	<u>Provinces</u>	<u>Cities/Mun</u>	<u>Precincts</u>	<u>Households</u>	<u>Adult Rs</u>
NCR	-	17	60	300	300
Bal. Luz	10	15	30	150	150
Visayas	5	15	30	150	150
Mindanao	5	15	30	150	150
	20	64	150	750	750

Rural

	<u>Barangays</u>	<u>Households</u>	<u>Adult Rs</u>
NCR	-	-	-
Bal. Luz	30	150	150
Visayas	30	150	150
Mindanao	30	150	150
	90	450	450

The proportion of male and female respondents is controlled to obtain an equal distribution of such respondents reflecting the population ratio. For odd-numbered questionnaires, males are interviewed. For even-numbered questionnaires, females are interviewed.

Fieldwork methods: Face-to-face interviews

Pre-testing the questionnaire. SWS pre-tests a questionnaire on some 5-10 adults for the following reasons:

- determine the time length of interview
- improve the wording of questions
- eliminate unnecessary questions and add items, as the case may be
- test question sequence and identify biases
- correct and improve translation
- change open-ended questions into multiple choice questions
- find out which items are conceptually vague
- determine whether the focus of the question is clear
- identify interviewer's recording difficulties

The survey questionnaire within which the ISSP module would be implemented was pre-tested from October 17-19, 1998.

Field quality controls. SWS puts much effort in seeing to it that quality data are gathered. Field quality control activities were undertaken. One, at least 10% of the total output of each field interviewer was

directly observed. A 'Supervision Report Form' documented this type of field observation. The field interviewer being observed was evaluated immediately after the conduct of the interview. A field supervisor did not allow the interviewer to do interviews alone until the latter was observed to have strictly followed the rules and techniques taught during the training.

Second, aside from field supervisors, there were field coordinators in the survey area who immediately edited the filled up questionnaires of the interviewers. This way, re-interviews, should there be a need, could be conducted while still in the field.

And third, spot-checking was undertaken at various stages of field work. The first one took place after about 30% of interviews were completed. The second spot-checking was conducted after 60% completion and the last one, immediately after 90% completion of interviewing.

During spot-checking, at least 20% of the unsupervised interviews were re-interviewed/back-checked. If serious errors persisted after 20% spot-checking, the original interviews were invalidated and respondents re-interviewed. An error was considered serious if dishonesty in recording was apparent or if there was a serious misinterpretation of the study such that it resulted in the wrong information.

If some questionnaires were found incomplete or had inconsistent answers, the interviewer was asked to go back to the respondent, so that the questionnaire could be completed and corrected.

Number of Calls. A respondent not interviewed on the first attempt was visited for a second time. If the respondent remained unavailable, a substitute who possessed the same qualities (in terms of gender, age bracket, and socio-economic class) as the original respondent was interviewed. The substitute respondent was taken from another household beyond the covered intervals in the sample precinct.

Sample size: 1200

Response rates:

	A - Total issued (total sample) (= B + C)
	B - Ineligible (address vacant, wrong ages,...)
	C - (= D + E) Total eligible (in scope sample)
1200	D - Total ISSP questionnaires received
	E - (= F + G) Total non-response
	F - Refusals (refusing to take part)
	G - Non-contact (never contacted)
	H - Other non-response

Language: Tagalog

Weighted: Yes

Weighting procedure: To yield representative figures at the national level, census-based population weights are applied to the subsamples in various area domains. The weight projection is computed by dividing the population count in the area by the sample size of the same area. Appropriate projection factors were applied so that original population proportions are reflected in the data tables using this formula:

- National Capital Region = 20.9666220000
- Luzon = 58.2718833333
- Visayas = 27.9290453333
- Mindanao = 31.2848600000

Remarks:

Coverage. The survey for the fourth quarter of 1998 covered the Philippines and the sample spots are found in the following cities/municipalities of the National Capital Region (NCR) and provinces of Luzon outside of NCR (Balance Luzon), Visayas and Mindanao:

<u>AREA</u>	<u>PROVINCES</u>	<u>CITIES</u>	<u>MUNICIPALITIES</u>
National Capital Region (NCR)	not applicable	Kabokan Makati Mandaluyong Manila Marikina Pasay Pasig Quezon City Valenzuela	Las Piñas Malabon Muntinlupa Navotas Parañaque Pateros San Juan Taguig
Luzon	Batangas Cagayan Camarines Sur Cavite Isabela Laguna La Union Pampanga Quezon Rizal		
Visayas	Bohol Cebu Guimaras Negros Oriental Southern Leyte		
Mindanao	Agusan Del Sur Bukidnon Davao Oriental South Cotabato Sulu		

Sample sizes and error margins. The indicator of data quality used is the standard error of estimates. The statistics which the survey obtained are mostly proportions, and the formula for the standard error of a proportion is:

$$\frac{p(1-p)}{n}$$

where p is the population probability and n is the sample size. The survey has a sample size of 1,200 male and female voting-age adults. It gives a maximum error margin of $+/- 3\%$ at 95% confidence level (assuming a simple sampling design), tolerable both for qualitative and quantitative variables.

For estimates of proportions, the sample breakdown implies that the following approximate allowances for sampling error, at the 95% confidence level, should be made:

<u>Location</u>	<u>Error Margin</u>
Philippines	+/- 3%
National Capital Region (NCR)	+/- 6%
Luzon	+/- 6%
Visayas	+/- 6%
Mindanao	+/- 6%

However, slightly higher error margins are expected in multi-stage cluster sampling, considering the complexity of estimating the exact sampling errors.

Study Description: Poland

Study title: Polish General Social Survey 1998/99 (PGSS)

Fieldwork dates: November to December, 1999

Principal investigators: Bogdan Cichomski, Institute for Social Studies, University of Warsaw

Sample type: Self-administered supplement completed after the main PGSS questionnaire.

Fieldwork institute: Public Opinion Research Center

Fieldwork methods: National Multi-stage Random Sample
 In the first stage the area of Poland was divided into 48 primary sampling units (strata). They consisted of 12 regions and 4 size classes: cities having more than 100 thousands inhabitants, cities between 20 and 100 thousands inhabitants, cities less than 20 thousand inhabitants, and villages. Statistical regions were drawn with probabilities proportional to number of households in each strata. Second stage households were drawn from statistical regions. Coming to every household an interviewer gathered information about month and year of birth of all persons living in the household and then selected respondent from all persons 18 or more years old, using Kish grid (unique for every household) selected the respondent.

Context of ISSP questionnaire: The ISSP data are part of the PGSS

Sample size: 1708

Response rates:

1708	A - Total issued (total sample)
	B - Ineligible (address vacant, wrong ages,...)
1147	C - (= A - B) Total eligible (in scope sample)
1147	D - Total ISSP questionnaires received
561	E - (= C - D; = F + G + H) Total non-response
411	F - Refusals (refusing to take part)
139	G - Non-contact (never contacted)
11	H - Other non-response

Language: Polish

Weighted: Yes

Weighting procedure: The weighting factor used consists of two elements. First each case was weighted by the number of persons 18 or more years old, living in a household. Then, post-stratification weighting was applied. Using official data about gender, age (three categories) and type of place of living (seven categories of size for the cities and eight regions for rural areas), a 90-cell table was created. For every cell a sampling rate was estimated. Post-stratification weighting was based on those coefficients. Finally, the weighting factor was normalized to the number of interviews completed.

Deviations from ISSP-questionnaire:

Study Description: Portugal

Study title: *Inquérito Permanente às Atitudes Sociais dos Portugueses*
 Portuguese Social Attitudes: annual survey

Fieldwork dates: April 1999

Principal investigators: Manuel Villaverde Cabral; Jorge Vala
 Instituto de Ciências Sociais da Universidade de Lisboa

Sample type: The universe of the survey is the Portuguese adult (18+) population resident in the Continent (excluding the Islands of the Autonomous Regions of Azores and Madeira). The sample (1200 individuals plus 720) is a probabilistic sample and was extracted according to the following steps:

- 1) Construction of Master Sample. Master Sample is a probabilistic sample based in the 91 Census, stratified by region (five regions in the mainland, Azores and Madeira). It has 1143 Census Blocks (1 Census Block has about 300 households).
- 2) Stratification of the 1143 Census Blocks of the master sample by urban/rural
- 3) Selection of 120 Census Blocks from the master sample (excluding Azores and Madeira)
- 4) Selection of 10 households plus 6 in each Census Block
- 5) Random selection of an adult in each household

Fieldwork institute: *Instituto Nacional de Estatística*

Fieldwork methods: The method employed was face-to-face computer assisted interviewing. The field work began in April and was completed within 4 weeks.
 All the interviewers were supervised and around 20% of the sections were 'back-checked'.

Sample size: 1201

The final achieved sample size was 1201, that makes a response rate of 80% (1201/1507) (sampling error $\pm 2.8\%$, $\alpha=.05$).

Response rates:

1507	A - Total issued (total sample)
	B - Ineligible (address vacant, wrong ages,...)
	C - (= A - B) Total eligible (in scope sample)
1201	D - Total ISSP questionnaires received
	E - (= C - D; = F + G + H) Total non-response

Principal investigators: Dr. L. Khakhulina

Sample type: Multi-stage stratified sample of the population of the Russian Federation aged 16 and over.

The persons interviewed - residents of Russia, from the number of the available constantly residing population, i.e, the sample does not include people temporarily present in a given location (on business trip, leave, medical treatment, Soviet Army soldiers; convicts in prisons, penitentiary colonies) as well as those who have no definite residence.

Sampling:

At the first stage, the territory of Russia is divided into 10 zones: North+North-West, Central Non-Black Earth, Central Black Earth, North Caucasus, Volgo-Viatka, Volga, Urals, West Siberia, East Siberia and Far East. They are designed by official statistics according to the ethnic, economic, demographic, geographic characteristics, agriculture, level of infrastructure, and standard of living. All eleven zones will be included in the sample.

The total sample size is distributed over the 11 zones proportionate to the population size in it.

The nine strata of settlements are created considering the following characteristics of places of settlement: population size, administrative status, autonomy/non-autonomy, urban/rural settlements:

1. Metropolitan Moscow and St. Petersburg areas (as the self-representative statistical units)
2. The oblast center cities of one million or more
3. Oblast capitals of less than one million residents.
4. Small towns and rural settlements of city type
5. Rural settlements/villages
6. Autonomous republic capitals of 300.000 residents or more.
7. Autonomous republican capitals of less than 300.000 residents.
8. Small towns and rural settlements of city type in autonomous republics.
9. Rural settlements/villages in autonomous republics.

The total number of questionnaires for a region is distributed over the strata proportionate to the population size of the stratum in the region's population.

For each stratum we define the maximum and minimum limits in the number of respondents for a sampling point of each type. According to the limits, we define the number of settlements of each type which is

to be included in the sample. If the number of questionnaires for a stratum is lower than the minimum limit, the stratum is united with a larger one ("of a higher level"). The number of the questionnaire of the new created stratum is equal to the sum of the two primary ones.

We define the number of the sampling points for each existing stratum of a region ('existing' means that the number of the questionnaires for the stratum is not equal 0). The total number of questionnaire for a stratum is divided into the previously defined maximum number of the questionnaires for sampling points. If the result has a fraction, we approximate it to the higher limit. The number of questionnaires for a stratum is equally distributed over all the stratum's sampling point.

We randomly choose the oblast, krais, and autonomous capital cities sampling points from the list of all the PSU in it with the probability proportionate to the population size.

At the second stage, within the chosen oblast's, krai's, and autonomous capital cities' areas, we randomly choose the other urban settlements with the probability proportionate to the population size.

In urban sampling points were randomly selected 2 or 3 electoral districts (no more than 10 interviews in each district) and the number of interviews relating to a city was equally divided between the electoral districts.

The field offices' supervisors choose rural places of settlement in the selected at the first stage oblasts, krais, and republics according to the following rules:

1. The number of sampling points is equally distributed over the chosen oblasts.
2. If there are more than one chosen rural settlement in the region, the number of the questionnaires is equally distributed over the rural settlements - the central estate of a farm and others rural settlements.
3. All the rural settlements are situated 50 and over Km away from the chosen regional center city.

Third stage. Selection of the households within a sampling point. The routine of the route method is as follows:

The territory of the city is divided into 2-3 areas (if the city's population is 500.000 and over - into 5-6 or more areas). Usually they are: the down town, industrial and living areas. The questionnaires which are to be completed in the city are distributed over the areas proportionally to the population size in them. (If the sample size is small, the questionnaires are distributed among 2-3 randomly chosen areas). We chose one district in an area.

The households within a district are chosen using the route method. (the same method is used for the rural settlements.) It is as follows: The sample step (r) is calculated as $r=S:n$, S - number of households in the district, n - the number of questionnaires to be administrated in it. The route begins from a household $N=r/2$ and then goes on with the step (r). The possible deviation is $+l/-l$ a household.

Fourth stage. Selection of the respondent within a household
 An interviewer has a task which includes: the discretion of the route, the number of questionnaire to be completed, and sex-by-age and educational quota card. Only one respondent is interviewed within a household.

The fieldwork supervisors control the sample using the sex-by-age and educational quotas. (We have to use the quotas as lot of people with secondary education refuse to answer the questionnaire more often, and it increases the number of people with higher education in the sample). The sampling is done with the help of the data of Goskomstat, 1997.

Fieldwork methods:

drop-off, face-to-face interview.

In the fieldwork, employees and part-time interviewers of 19 VCIOM regional offices were engaged. The completions are done by respondents at their home in the presence of the interviewer who was to prevent an influence of other household members on answers of the respondent. If a respondent was absent at the moment of an interviewer's call, callbacks to this address were envisaged, not exceeding three in number.

The work of every interviewer was controlled by telephone or a callback in the proportion of 1 per 10 interviews.

Context of ISSP questionnaire

The questionnaire of the study included 119 questions (including the socio-demographic bloc).

ISSP-modul, consisting of 38 questions plus 23 special demographic questions were located in separate booklet which were completed after main booklet (block questions concerning of economical and political situation of the country; the level of ordinary life's problems; trust in political leaders, parties and social institutions; voting intentions; attention to some foreign-policy problems - totally 53 questions and main socio-demographic questions).

Sample size:

1703

Response rates:

3963	A - Total issued (total sample) (= B + C)
744	B - Ineligible (address vacant, wrong ages,...)
3219	C - (=D + E) Total eligible (in scope sample)
1703	D - Total ISSP questionnaires received
1516	E - (=F + G) Total non-response
954	F - Refusals (refusing to take part)
457	G - Non-contact (never contacted)
105	H - Other non-response

Language:

Russian

Weighted:

Yes

Weighting procedure: Reference on the distribution of respondents' totality and corrected sampling by controlled social groups

The principles of posterior sample's correction:

The correction is realized separately for every generalized region (oblast')

The total expected number N of respondents for a certain region equals

$$N = N_0 * P,$$

where N_0 denotes the size of whole sample, P stands for share of the region in the entier population.

There are population groups involved in correction process:

Gender groups

1. Male;
2. Female.

Age groups

3. 16 - 24 years;
4. 25 - 39 years;
5. 40 - 54 years;
6. 55 and over years.

Education groups

7. High school or incomplete one;
8. Common school (9-10 classes) or special engeneerings;
9. Incomplete common school.

Weight coefficients are defined as extreme ones for the sum of squares of deviations of weighted estimates from corresponding precise values of proportions of the following social groups within the surveyed population.

As a result of correction every respondent $X[k]$ becomes supplied with definite weight $W[k]$, being within the limits $0 < W[k] < \sim 10$, so that the following conditions were valid:

- 1) the value of sum ($W[k]$) for region concerned were equal to N and
- 2) for every controlled group $G[i]$ the value $Q[i]$ being equal to

$$Q[i] = \text{sum} (W[k] | x[k].\text{belong to.}G[i]) / N,$$

were closed to a share $P[i]$ of group $G[i]$ in region's population.

The value of J being equal to

$$J = \text{sum} ((Q[i] - P[i])^{**2}) + (\text{sum}(W[k])/N - 1)^{**2},$$

serves the criterion for minimization on the weights' sets variety.

Group	1	2	3	4	5	6	7	8	9
In massif	4497	5502	1785	3024	2337	2854	1914	5026	3059
Weighted (p)	4566	5433	1596	3125	2356	2921	1438	4704	3857
Statistic	4567	5432	1595	3130	2353	2921	1433	4713	3852

The deviation in structure of controlled social groups makes on the average less than 0.05 %

Weight coefficients of respondents are distributed as follows:

Value	Quantity
0.000 - 0.100	0
0.101 - 0.200	0
0.201 - 0.500	249
0.501 - 1.000	771
1.001 - 2.000	592
2.001 - 5.000	85
5.001 - 10.000	6
10.001 >	0

Sum of weight coefficients is 1703. All the coefficients are recorded in "weight" field.

Deviations from ISSP questionnaire:

Question "EARNINGS" is coded in roubles

Question "FAMILY INCOME" is coded in roubles

In question "PARTY AFFILIATION II" the parties were coded as follows:

- 1 'Agrarian Party'
- 2 'National-Patriotic Union'
- 3 'Yabloko'
- 4 'Women of Russia'
- 5 'Our Home is Russia (NDR)'
- 6 'Democratic Choice of Russia (DVR)'
- 7 'KPRF'
- 8 'LDPR'
- 9 'Peoples Republican Party'

The scale of question "REGION"

- 1 'North'
- 2 'North-West'
- 3 'Central'
- 4 'Volga-Vyatka'
- 5 'Black Earth'
- 6 'Volga'
- 7 'North Caucasus'
- 8 'Urals'
- 9 'West Siberia'
- 10 'East Siberia'
- 11 'Far East'

The scale of question "SIZE OF COMMUNITY"

- 1 More than 1 million
- 2 500.001 – 1.000.000
- 3 250.001 – 500.000
- 4 100.001 – 250.000
- 5 50.001 – 100.000
- 6 20.001 – 50.000
- 7 up to 20 000 urban
- 8 Rural

Study Description: Slovenia

Study title: Slovenian Public Opinion 1998/1 - Inequality and Religion (ISSP, 1998-1999)

Fieldwork dates: October 1998

Principal investigators: Niko Toš, Public Opinion and Mass Communication Research Centre (CJMMK), Ljubljana

Sample type: Systematic multistage sample with random start of adults aged 19 years or older living at noninstitutional address in Slovenia, based on Central Register of Population. 140 PSU and 420 SSU are formed, with names and addresses of persons in final clusters. A replacement procedure is used for non-responses, with substitute units reselected by the same probability mechanism as basic sample units. Half of the sample with every second person selected were used for SJM98/1 (ISSP) and SJM98/2 (non-ISSP) Survey respectively. See: Marjan Blejec: Nacrti in analiza vzorcev za ankete "Slovensko javflo mnenje" SJM68 SJM69 in SJM70, VSSPN, Ljubljana 1970

Study Description: Slovakian Republic

Study title: Religion

Fieldwork dates:

Principal investigators: M Piscova, Slovak Academy of Sciences, Bratislava

Sample type: In the "Religion" survey, sampling was done by the random selection procedure we use to call random walk technique. It is the set of rules that is applied in gradual choice of (a) a house (block of flats) doorway; (b) an apartment and (c) a person (a household member). The term walk is used because the sampling procedure is done by walking across the itinerary determined by the departure point and movement rules. Instructions for random walk were as follows:

A. Itinerary of random walk

Any public institution that is a closest one to the place of the interviewer's residence may serve as the departure point - a shop, post office, an office, health care service, etc.. The interviewer has to turn his back to the institution building door and then go in the right direction along the street. He goes on the right side of the street and has to count out houses of block of flats doors (if a building has several doors) on this side of the street. Houses are counted out till the first crossing. On the crossing, an interviewer has to turn left and go in the left direction along the left side of street. He or she continues counting out houses or doors.

On the next crossing he or she turns right and counts out the doors on the right side of a street in compliance with the given rules. During the next route he always continues according the rule of changing the right-left direction on every crossing point - if he or she turns left, he goes on the left side of the street and on the next crossing he turns in the right direction and walks on the right side of street.

On the random walk route, an interviewer has to select always every fifth house (block of flats door), in which an appropriate respondent is looked for in conformity with the next instructions.

If there are no houses on the street side of your walk, an interviewer walks to the next crossing and he again changes direction there.

Comments:

In the random walk procedure, we treat as the crossing every place where it is possible to turn to the adjacent street in the determined direction of walk. The crossing is also the place where your way crosses a pedestrian or footpath that is surrounded by residential buildings. As a crossing we do not consider any level crossing or highway leave or an access to a building.

If the crossing has a T-form and the street vertical to the direction of your route leads to the direction that is opposite to the direction set by the random walk rules (for instance, if you are expected to turn left on the next crossing and the crossing has a T-form and leads only to the

right direction), the interviewer continues in his initial direction to the next crossing where it is possible to turn in the determined way. The interviewer will proceed similarly in the case, if the street you should turn to according the rule is a blind alley or it leads to an uninhabited area (for instance, out of the town or to an industrial area), he continues his way to the next crossing and will change direction only there.

In the case that in spite of these measures your random walk will take you to uninhabited space or outside town or village, you will turn back and continue your counting out the houses (or block of flats doors) on the opposite side of street till you will not return back to the point (crossing) you originally turned in that "unproductive" direction. On this crossing, you choose the opposite direction to that "unproductive" one and then continue your walk according the given rules.

In the case that during his random walk the interviewer finds himself on the housing estate where the streets and crossing are difficult to differentiate, he will regard the blocks of flats as streets and move between them in similar way: on the end of the block he will turn in the determined direction and count out the doors of the next block of flats in his walk direction.

If all blocks of flats are built in one direction, the interviewer has to walk between them alternately in left and right direction and to count out the doors on that side of the block where the main door entrances are situated.

B. The selection of an apartment in the block of flats

On his random walk route, the interviewer has always to enter every fifth house (or door). If there is only one flat in a house, he selects it automatically.

If there are two, three or four flats in a house, he will always select the second in the order. He has to start to count out on the left side of the door, or on the left side of the stairs (if the flats are only on the floor). If there are five and more flats in a house, the interviewer will select every fifth in the order. He again counts out the flats on the left side (of the entrance or stairs). If for instance, there are always two flats on the same floor (and there are no flats on the ground floor), the fifth flat is situated on the third floor and it is the one that is on the left from the stairs.

C. The selection of respondent in a household

In the randomly chosen flat/household, the interviewer will address any of its inhabitants and establish the names of all household members more than 18 years old. He will put the names in the table on the second page of the questionnaire and he will select the one according the questionnaire instruction (the one whose birthday date is the closest to the term of the interviewer's visit - either it proceeds or follows it).

If the selected respondent is not in the household in the moment of interviewer's visit, the interviewer will ask when he or she would be accessible in home and the interviewer will visit the household again. If selected respondent will be not at home also in the time of the

second visit, the interviewer will make the third trial to meet him. If the third trial will be not successful too, the interviewer will choose a next household on his random walk route.

In the case nobody was at home in the selected flat, or the interviewer was strictly refused, he will go to the next (that is, sixth in the order) flat and he will make the selection there.

If the interviewer will not find any person in the selected house that would meet the selection requirements, he will continue on his random walk route to the next fifth house and he will repeat selection of flat and person there.

D. The end of random walk

Random walk finishes in the moment where the interviewer succeeds to obtain five completed interviewees. Certainly, random walk needs not to be done in one day, it can be done by parts. However, the interviewer has always to continue his walk on the same place he ended his walk last time.

Fieldwork dates: January – March 1999

Principal investigators: Research team from the Institut d'éthique sociale de la Fédération des Eglises protestantes de la Suisse ("IES de la FEPS") in Lausanne.

Sample type: The population surveyed consisted wholly of German, French or Italian speakers aged between 16 and 75, who were living in Switzerland during 1998/9. The ISSP survey questions were asked via a written questionnaire sent by post to the homes of those people who had already taken part in the research "Religion and the social bond" by means of a telephone interview. The sample was made up of people who had been reached by telephone and who were available. The 5% of the population that does not have a private telephone link were therefore excluded. Both the households and their representatives were selected by means of the random-random method, in accordance with a random system. This procedure was chosen in order to avoid several people within one household being questioned.

Fieldwork institute: Research institute Link in Lucerne and Lausanne

Fieldwork methods: The survey consisted of a CATI with an average duration of 40 minutes and a standardized written follow-up questionnaire. The telephone interviews began on January 1999. After the interview, the participants received the written ISSP questionnaire and a small gift (a telephone card) by post. If the questionnaire was not returned within three or four weeks, a reminder and another questionnaire were sent. To verify the authenticity of the written questionnaires and to gather together replies from telephone and written interviews, each telephone conversation was given the same identification number as each page of the corresponding written questionnaire. The written questionnaires were collected until end of March 1999.

Context of ISSP questionnaire The present Swiss set of data on values is part of an extensive survey carried out within the joint project "Religion and the social bond" from the "Institut d'éthique sociale de la Fédération des Eglises Protestantes" ("IES de la FEPS"). The joint project consists of two survey sequences and is financed by the Swiss National Science Foundation. The standard ISSP background variables were collected partly through the CATI (repeating the 1988 module "Croire en Suisse(s)") and partly through the written questionnaire. The person in charge of this project is Roland J. Campiche. From the three optional questions, numbers one and three were asked. They were placed in their original order. Six other questions were also added to the ISSP questionnaire. These will be used in the framework of the research "Religion and the social bond" (if needed we can send the original written version of the CATI).

Sample size: 1283

Response rates: Firstly, a random sample of 4800 households was taken from the official Swiss telephone directory. There was no response from 148 telephone calls, 507 numbers were wrong or were not private numbers. 160 numbers had to be abandoned on account of language problems. In 27 cases the people contacted were about to leave for a prolonged stay abroad, in 2 cases the person was dead, in 84 the person contacted had physical and/or psychological problems and in 361 cases their age was outside the defined limits of the field. In the end, the scaled down sample was made up of 3509 households. 1062 of these declined to indicate the structure of the household, 248 by a simple refusal, 89 stating lack of time, 264 saying they were against surveys as a matter of principle, 159 were against telephone surveys, 39 for family reasons, 45 stating that religion was a private matter, 79 for other reasons and 138 by not giving any reason. It was possible to take a census of the structure of 2447 households. In each of these households, one person whose age was within the defined limits of the field was chosen at random. At the time of the initial interview, if the person targeted was at home, an appointment for a telephone interview was arranged with them. Their address was recorded so that survey documents (lists) could be sent, together with a covering letter. If the person targeted was not there, it was arranged to call them back. Of the 2447 people targeted, 14 could not be reached even after several telephone calls (up to 50) or who otherwise did not keep the appointment. In 25 cases the telephone number was not correct or caused a problem. 183 of the people targeted refused to take part in an interview, 59 saying they were not interested, 19 that they did not have the time, 35 that they were against surveys as a matter of principle, 19 that they were against telephone surveys, 6 refused for family reasons, 5 because they considered religion to be a private matter, 9 for other reasons. 312 of the people targeted refused to take part in an interview without giving any reason. 102 did not take part for other unforeseen reasons (39 on account of language problems, 29 on account of a prolonged stay abroad, 30 on account of health problems and 4 on account of age-related problems). In the end, appointments were made with 2123 people. Telephone interviews had to take place at the earliest one week after the initial contact, given that the lists had been sent out. The respondents could decide on the date and time of the interview within the working hours of the survey institute (Monday to Friday from 8 a.m. to 9 p.m. and Saturday from 9.30 a.m. to 6 p.m.). On request, the person targeted could be reached either at their place of work or somewhere else. Of these 2123 people, 187 could not be reached, in spite of several telephone calls or else did not keep the interview time. 11 telephone numbers had to be abandoned because of problems with the number. 179 people refused to take part: 49 saying that they were not interested, 24 because they did not have the time, 23 because they were against surveys as a matter of principle, 13 because they were

against telephone interviews, 5 for family reasons, 25 because they considered religion to be a private matter, 31 for other reasons and 9 people who refused without giving a precise reason. 82 contacts were abandoned for other reasons: 36 on account of language problems, 23 on account of a prolonged stay abroad and 23 on account of health problems.

In the end, **1664 telephone interviews were carried out**: 1027 in German, 417 in French and 220 in Italian. 1054 interviews were carried out in the German-speaking region, 330 of these in the canton of Zurich (further sampling on request), 409 in the French-speaking region and 201 in the canton of Tessin. There was the possibility of changing the language used in conversation to that of the person being questioned (German, French or Italian). At the end of the standardized computer aided telephone interview (CATI), the questioner indicated that a personalized questionnaire would be sent by post a few days later.

1664 ISSP questionnaires were sent by post to those people who had taken part in the CATI. The survey institute sent out written reminders to all those who had not returned the questionnaire within three or four weeks.

Of the 1664 people who received the questionnaire by post after the CATI interview, 381 did not return it in spite of written reminders or were unusable. 1283 ISSP surveys were carried out.

Language:

The ISSP questionnaires have been translated into the three national languages: German, French and Italian by the team of the "IES de la FEPS" and then compared to translations from the three countries of Germany, France and Italy. Adaptations were made with regard to the use of certain local expressions in these three languages. Most of our changes made with regard to translations within the same languages by these other countries were justified by a concern to remain true to the original English version. Great importance was given in translation to the harmonization of terms within the three languages with a view to a joint use of responses. The translation also took into account the principle of equality between the use of feminine and masculine, the accessibility and simplicity of language and the clarity of terms and conditions.

Weighted:

Yes

Weighting procedure:

The selection of households and respondents by the random-random method necessitates weighting of data in accordance with the known socio-demographic structure in Switzerland. Thus the weighting (variable name 'WEIGHT) was carried out by means of a factor combining the three following variables: sex, age and linguistic region for the Swiss sampling ($n=1204$) based on an assessment of the socio-demographic evolution of the Swiss population since the federal census of 1990 (ESPOP 1998). The difference between the number of responses (1283) and the number of cases (1204) is due to the fact that

in the total sampling, inhabitants from Zurich are overrepresented (n=79).

Known systematic properties:

Some ISSP variables have been coded differently by the research team from the "IES de la FEPS" because they should not have more than 8 characters. We proceeded to delete the ninth character of the ISSP variables CLERGVOTE, GODMEANNG and EGOMEANNG.

As far as the variables MARELKID, PARELKID and RELIGSP are concerned, there are very few persons having specified their "other" religious preference. This is not the case for the responses given to the CATI questions about religious preferences. We proceeded to re-group the heading "can't say / can't remember" of the variables ATTENDMA, ATTENDPA and ATTEND12 under the heading "missing".

The standard ISSP background variables form part of the telephone survey and have been coded differently by the research team from the "IES de la FEPS". Twelve observations are vital:

1. The variable MARITAL (marital status of the respondent) and COHAB (steady life-partner): Our list of replies to this question was different. In our questionnaire we proceeded to code it in the following way:

- unmarried
- living together (unmarried, widowed, divorced)
- married
- widowed and remarried
- divorced and remarried
- widowed
- separated
- divorced
- no response

As a result, our first and second headings were first reduced to one ISSP heading (unmarried) and then separated into two ISSP headings (COHAB) and our three headings for married people were reduced to one ISSP heading (married).

2. The variables EDUCYRS (educational years in school): In order to express the data within ISSP terms, we have combined two of the variables:

CATI question 26, the number of years in training and CATI question 27 showing those currently in training (95.00): we cannot separate "still at school" from "still at College/University".

3. For the variable DEGREE (highest education level) we used CATI question 25, at what stage did they finish school. In this way we created the DEGREE variable which applies to the Swiss situation (DEGREECH, country specific). It should be considered with care.

4. The variable WRKST (current employment status): The heading «employed less than part time/temporarily out of work» consists of those people who replied «in temporary professional employment» and «housewife (or house husband) not in paid professional employment». The heading «Helping family member» is not on our list (neither in the

list of the variable SPWRKST).

5. Occupations were registered with help of a database containing over 13000 occupational labels (supplied by the Swiss Federal Statistical Office) that could be accessed online during the CATI. We formulated the question in the following way: "Which profession do you practice currently or which is the last profession you practiced?". The variable ISCO88 was generated automatically, since the database also contained information on the assignment of each occupation label to the ISCO88 scheme. The headings "Refused", "Don't know, inadequately described" and "INAP (never had a job)" were not in our list. We proceeded to group the headings "No answer" and "missing" of our list under the heading "No answer".

6. The variable WRKSUP: The headings "Refused", "Don't know" and "INAP" were not in our list.

7. The variable WRKGGOVT: The heading "Works for publicly owned firm" was not in our list.

8. The variable NEMPLOY: Our heading ".OO" means "self employed without any employees" and our heading "88888.00" corresponds to the ISSP heading "00000. INAP".

9. The variable SPISCO88: In our list the headings "Refused", "Don't know" and "No answer" are re-grouped under the heading "No answer".

10. The variable CH_PRTY (party affiliation, Switzerland): The variable CH_PRTY was part of the telephone interview. In the following table you can find the French, Italian, German and English names of the Swiss parties.

*	French	Italian	German	English	ISSP
01	Parti démocrate chrétien (PDC)	Partito popolare democratico (PPD)	Christlichdemokrat ische Volkspartei (CVP)	Christian Democratic Party	3 Center / liberal
02	Parti évangélique suisse (PEV)	Partito evangelico svizzero (PEV)	Evangelische Volkspartei der Schweiz	Evangelical People's Party	3 Center / liberal
03	Parti radical démocratique (PRD)	Partito liberale radicale (PLR)	Freisinigdemokratische Partei (FDP)	Radical Party	4 Right / conservative
04	Parti Socialiste (PS)	Partito socialista (PS)	Sozialdemokratische Partei (SP)	Social Democratic Party	2 Left / center left
05	Union démocratique du Centre (UDC)	Unione democratica di Centro (UDC)	Schweizerische Volkspartei (SVP)	Swiss People's Party	4 Right/ conservative
06	Alliance des Indépendants (ADI)	Anello degli Indipendenti (ADL)	Landesring der Unabhängigen	Independent Party	3 Center / liberal
07	Parti libéral	Partito liberale	Liberale Partei der Schweiz	Liberal Party	4 Right / conservative
08	Parti Suisse du Travail	Partito svizzero del lavoro	Partei der Arbeit der Schweiz	Labor Party	1 Far left, etc.
09	Démocrates suisses (Action nationale, Républicains)	Democratici svizzeri (azione Nazionale, Repubblicani, Lega Ticinese)	Schweizer Demokraten (Nationale Aktion / Republikaner)	Swiss Democrats	5 Far right, etc.

10	Les verts (p. écologiste suisse)	Partito ecologista svizzero (PES)	Die Grünen (Grüne Partei Schweiz)	Green Party	1 Far left, etc.
11	Parti suisse de la liberté	Partito svizzero della libertà (degli automobilisti)	Freiheitspartei (Autopartei)	Freedom Party	5 Far right, etc.
12	Autre	Altro	andere	other	6 Other
13	Je m'intéresse à la politique mais je n'ai pas de préférence pour un des partis	Mi interesso di politica ma non ho nessuna preferenza per uno di questi partiti	Ich interessiere mich für Politik aber ich habe zu keiner dieser Parteien besondere Sympathien	I am interested in politics but I do not prefer either of these parties	7 No party
97	Je ne m'intéresse pas tellement à la politique	Non mi interessa molto la politica	Ich interessiere mich nicht so sehr für Politik	I am not interested so much in politics	8 Don't know
99	Pas de réponse	NR	k. A.	no answer	9 No answer

* Numbers in the list of the CATI

PARTY_LR is a recoding of variable CH_PRTY. It has bee taken from to the classification used by the team of the University of Berne working on the Swiss 1997 ISSP Module on "Work Orientations".

11. The variable ATTEND (attendance of religious services): We thought it necessary to maintain the distinction between a particular frequency: «only at religious festivals (e.g. Christmas, Easter)» and «only on family occasions such as baptisms, weddings and funerals». These two have been re-grouped under the ISSP heading «less frequently».

12. The variable CLASS: The two separate headings of our list for "upper working class" and "lower middle class" are grouped under the ISSP heading "upper working class / lower middle class. Our heading "can't choose" is under the ISSP heading "Don't know" while our "no class" is under the ISSP heading "None of these."

Study Description: USA

Study title: 1998 General Social Survey

Fieldwork dates: February – May 1998

Principal investigators: James A. Davis, Tom Smith

Sample type: Multi-stage area probability sample

Fieldwork institute:

Fieldwork methods: In-person with self-administered questionnaire

Context of ISSP questionnaire Self-administered questionnaire at end of in-person interview

Sample size: 1284

Response rates:

2311	A – Total issued (total sample)
439	B – Ineligible (address vacant, wrong ages,...)
1872	C - (= A - B) Total eligible (in scope sample)
1284	D – Total questionnaires received
	E - (= C - D; = F + G + H) Total non-response
509	F – Refusals (refusing to take part)
33	G – Non-contact (never contacted)
46	H – Other non-response

Language: English

Weighted: No

Known systematic properties: Undersamples men

National Population Characteristics: USA

A Comparison of the 1998 Current Population Survey to the 1998 General Social Survey
Tom W. Smith, Clifford Young, and Jennifer Berkman – April, 1998.

In accordance with the documentation standards of the International Social Survey Program (ISSP), we compare in Table 1 the distributions for age, gender, years of schooling, and labor force participation from the 1998 General Social Survey (GSS) with the *latest* available Census estimates from the 1998 Current Population Survey (CPS). (The 1998 GSS fielded the work orientation II and religion II modules).

First, the weighted and unweighted GSS distributions match the CPS figures about equally well overall (Table 2). The weighted figures are better on gender and among the young, while the unweighted figures are closer on some age and labor force categories.

Second, the GSS-CPS matches are generally good. Age distributions correspond closely across most age groups, but the GSS did underrepresent those under 25. This is primarily due to the high number of people in the non-household population for this age group. Women are overrepresented on the GSS. This is common to virtually all full probability, random respondent surveys. (The CPS uses household informants rather than random respondents.)

Third, the GSS overrepresents the college educated and underrepresents the less educated. It appears that much of this difference results from variations between the CPS and the GSS in how the item on education is asked and coded rather than because of sampling representation. Finally, the GSS underrepresents those not currently employed. At least some of this difference comes from the 16 and 17 year olds included in the CPS figures. Very few are currently employed and their inclusion lowers the total percent employed and increases.

Codebook Information

The example below is a reproduction of information appearing in the machine readable codebook. The numbers in angular brackets < > do not appear in the codebook, but are references to the descriptions which follow the example.

Example:

<1>	<2>
V4	Obey laws without exception

<3> <4> <5>
 Location: 14 MD1: 9 Dec.places:
 Width: 1 MD2: 8

<6>
 Q.8 In general, would you say that people should obey the law without exception, or are there exceptional occasions on which people should follow their consciences even if it means breaking the law?
 (Please tick one box only)

- <7>
 <----->
 <8> <9>
 1. Obey the law without exception
 2. Follow own conscience on occasions
 8. Can't choose, don't know
 9. NA, refused

Explanations

<1> A variable (and reference) number have been assigned to each item in the study. In the present codebook which documents the archived data set, these numbers are identical. Should the data set be subsetted or rearranged the variable numbers might change to reflect the order of the new data set while the reference numbers would remain unchanged to provide a link to the archived data set.

<2> Indicates the abbreviated (24 character maximum) variable label used within OSIRIS or SPSS system files.

<3> "Location" indicates the starting position of the variable when the dataset is stored in the OSIRIS format."Width" describes the number of positions of the variable.

<4> "MD" indicates the designation of the missing data. MD1 indicates an explicit defined single value. MD2 designates a single value or a value range, i.e. all values equal or greater than this value have been declared missing. Although these categories are defined as missing data categories, this does not mean that the user should not or cannot use these codes if so desired.

<5> If a variable contains implied decimals, the message "Dec.places: xx" appears here, where xx is the number of decimal places.

<6> Indicates the full question text taken from the British questionnaire. Wherever possible the original sequence of questions has been retained, although some changes were necessary to integrate the different national questionnaires.

<7> Indicates commentaries and explanations added during the processing of the study. < within question or answer texts may indicate whether the questionnaire in a particular country is deviating from the general format.

<8> Indicates the code value for the single answer category.

<9> Indicates the textual definition of the codes. Abbreviations commonly used are DK (don't know), NA (no answer), Can't choose, Not applicable and Not available.

<10> Indicates percentaged frequencies by country. This form is used whenever code categories have the same meaning for all countries. Column percentages are based only on "valid cases". Missing data values were excluded from percentages.

V32 Volunteer work: political activities

Location: 42 MD1: 9
 Width: 1

Q.16 Have you done any voluntary activity in the past 12 months in any of the following areas? Voluntary activity is unpaid work, not just belonging to an organisation or group. It should be of service or benefit to other people or the community and not only to one's family or personal friends. (If the same voluntary activity falls under two or more of the categories listed above, please report it only once under whichever relevant category appears first. For example, if you were involved in political campaigning for a candidate endorsed by a church or religious group, you would report it under a. Political activities not under c. Religious and church-related activities.)
 During the last 12 months did you do volunteer work in any of the following areas:

Q.16a Political activities (helping political parties, political movements, election campaigns, etc.)

1. No
2. Yes, once or twice
3. Yes, 3-5 times
4. Yes, 6 or more times

9. No answer, don't know

V56 R child, father how often attend church?

Location: 71 MD1: 00
 Width: 2 MD2: 98

Q.29 When you were a child, how often did your father attend religious services?

J: ..., how often did your father attend religious services or go to pray at temple/ shrine other than 'Hatumode', wedding or funeral?
 (Please tick one box only)

- 01. Never
 - 02. Less than once a year
 - 03. About once or twice a year
 - 04. Several times a year
 - 05. About once a month
 - 06. 2-3 times a month
 - 07. Nearly every week
 - 08. Every week
 - 09. Several times a week
- RP: + once a day; several times a day

98. Can't say/ can't remember

99. No answer

00. Never knew father/ no father/ father not present

RP: Father was not around

D,A: Father dead/ unknown

V62 Rights of Rs close friend

Location: 81 MD1: 0
 Width: 1 MD2: 8

Q.35 Suppose you were riding in a car driven by a close friend. You know he is going too fast. He hits a pedestrian. He asks you to tell the police that he was obeying the speed limit.

Q.35a Which statement comes closest to your belief about what your friend has a right to expect from you?

1. My friend has a definite right as a friend to except me to testify that he was obeying the speed limit
2. My friend has some right as a friend to except me to testify that he was obeying the speed limit
3. My friend has no right as a friend to except me to testify that he was obeying the speed limit
8. Can't choose

V65 Picture of God: mother - father

Location: 84 MD1: 0
 Width: 1 MD2: 8

Q.37 There are many different ways of picturing God. We'd like to know the kinds of images you are most likely to associate with God. Below are sets of contrasting images. On a scale of 1-7 where would you place your images of God between the two contrasting images?

The first set of contrasting images shows Mother at 1 on the scale and Father at 7. If you imagine God as a Mother, you would place yourself at 1. If you imagine God as a Father, you would place yourself at 7. If you imagine God as somewhere between Mother and Father, you would place yourself at 2, 3, 4, 5, or 6.

Where would you place your image of God on the scale for each set of images?

Q.37A Picture of God: Mother - Father

1. Mother

V73 World image: much evil vs. much good

Location: 92 MD1: 0
 Width: 1 MD2: 8

Q.39 People have different images of the world and human nature. We'd like to know the kinds of images you have. Below are sets of contrasting images. On a scale of 1-7, where would you place your image of the world and human nature between the two contrasting images?

Look at the first set of contrasting images. If you think that "The world is basically filled with evil and sin", you would place yourself at 1. If you think "There is much goodness in the world which hints at God's goodness", you would place yourself at 7. If you think things are somewhere between these two, you would place yourself at 2, 3, 4, 5, or 6. Where would you place your image of the world on each of scales below?

Q.39A World-image: Much evil vs. much good

1. The world is basically filled with evil and sin
- 2.
- 3.
- 4.
- 5.
- 6.
7. There is much goodness in the world
8. Don't know

Education I: Years in school

- AUS: What is the highest grade or year of (primary or secondary) school you have completed?
 D: How many years from school to university education but without vocational training?
 GB: Years in school: Recode from - How old were you when you completed continuous full-time education?
 USA: What is the highest grade in elementary school or high school that you finished and got credit for?
 I: How many years in general have you studied? (Consider years at primary school to university grades)
 IRL: How many years of full-time education did you receive?
 NL: Years of schooling following R's sixth birthday included vocational training
 N: Years in school after compulsory education
 S: How many years have you attended school, all full-time education included?
 CZ: Can you please count how many years in total you attended school? Include all years spent in any schools, even if you didn't complete the course of study, and/ or years of study in other than full-time education programs
 PL: Highest years of school completed
 RUS: How many years altogether did you study?
 (Including vocational training)
 SLO: How many years in regular formal schooling?
 NZ: How many years of full-time education have you had?
 (include primary school, intermediate, secondary school, university and polytechnic but not vocational training)
 RP: Actual number of years of full-time schooling

- 01. 1 year
 AUS: 0 or 1 year
- 08. NZ: 1-8 years
- 09. 9 years
 N: 7-9 years, only compulsory
- 11. NZ: 9-11 years
- 13. NZ: 12-13 years
- 14. ..
- 15. NZ: 14-16 years
- 17. NZ: 17 years and more
- 50. 50 years and more

- 94. Other answer
- 95. Still at school
 J: Still at high school
 N,CH: Still at school + still at university
- 96. Still at college, university
- 97. No formal schooling, still at school

- 98. Don't know
- 99. No answer
 E: No answer, don't know

V205 <DEGREE> R: Education II: categories

Location: 207 MD1: 99
 Width: 2

Education II: Categories

AUS: What is your highest qualification?
 D : What kind of a complete general school-education do you have?
 GB: Highest educational qualifications obtained
 USA: What is the highest degree?
 H: Completed school grades
 I: Degree of study
 N: What kind of general education, what kind of vocational education/training, what kind of education on university/college level have you completed? Note: compulsory school was 7 years until about mid 1960's; 9 years of compulsory school was introduced during the 1960's, but at different times in different parts of the country.
 CZ: What is your highest achieved level of education?
 SLO: Name last school you completed, regularly or while working?
 PL: What is the highest education level you have finished?
 BG,S:Highest level of education
 RUS: What education do you have?
 IRL: What is the highest level of education that you attained?
 NZ: Highest level of formal education
 J: What is your highest school qualification?
 RP: Educational attainment of respondent
 E: (If not illiterate) Highest level of education

01. None, still at school
 02. Incomplete primary
 - E: Incomplete primary, illiterate
 - D: School without qualification
 03. Primary completed
 - NL: Basic education plus vocational training
 - D: 'Volks- Hauptschule'
 - USA: Less than high school
 - NZ: Primary school (including intermediate)
 04. Incomplete secondary, technical school
 - A: Apprenticeship completed, vocational middle school
 - D: Middle school, polytechnic (completed 10.class)
 - CH: Apprenticeship completed
 - IRL: Some second level, group certificate or equivalent, intermediate certificate or equivalent
 - S: Secondary education, non-academic track
 - NZ: Secondary school (for up to 3 years)
 05. Secondary completed
 - NL: Lower grammar school, commercial school plus vocational training, 5 years grammar school
 - D: Abitur, 'Fachhochschulreife'
 - USA: High school
 - A: Matura
 - IRL: Leaving certificate or equivalent
 - S: Secondary education, academic track
 - NZ: Secondary school (for 4 years or more)
 06. Incomplete + complete semi-higher qualification, incomplete university, others
 - D: 'Fachhochschule' completed
 - NIRL: Other
 - USA: Junior college, Bachelor
 - F: Incomplete university, college
 - IRL: Third level incomplete, certificate or diploma
 - NZ: Some university, polytechnic or other tertiary, Completed trade, professional certification
 07. University completed
 - NIRL: Degree level and higher education below degree
 - USA: Graduate
 - NL: University, technical university, teacher training
 - NZ: Completed university or polytechnic degree
99. No answer

V218 <ATTEND> R: Religious services - how often

Location: 244 MD1: 0
 Width: 1 MD2: 8

Church attendance: How often do you attend religious services?

GB: (If any religion) Apart from such special occasions as
 as weddings, funerals and baptism, how often nowadays do you
 attend services or meetings connected with your religion?

J: How often do you attend religious services or go to pray
 at temple/ shrine other than 'Hatumode', wedding or funeral?

RP: How often do you pray?

1. Once a week or more, nearly every week
 RP: Several times a day, once a day, several times
 a week, every week
2. 2-3 times a month
 A: 1-3 times a month
 GB: At least once in a fortnight
 SLO: 2-3 times a month, nearly every week
3. Once a month
 GB: At least once a month
4. Several times a year
 GB,NIRL,CZ: + Once or twice a year
5. Less frequently
 GB,NIRL: Less often than once a year
 AUS,H,I,N,NZ,SLO,RUS,RP,F: 1-2 times a year, less
 than once a year
 IRL: less than once a year
6. Never
8. Don't know, GB: varies too much

- 6142 Charcoal burners and related workers
- 6150 Fishery workers, hunters and trappers
- 6151 Aquatic-life cultivation workers
- 6152 Inland and coastal waters fishery workers
- 6153 Deep-sea fishery workers
- 6154 Hunters and trappers

Note 0001

(continued)

6200 Subsistence agricultural and fishery workers
 6210 Subsistence agricultural and fishery workers

Craft and related trades workers

7000 Craft and trade workers
 7100 Extraction and building trades workers
 7110 Miners, shotfirers, stone cutters and carvers
 7111 Miners and quarry workers
 7112 Shotfirers and blasters
 7113 Stone splitters, cutters and carvers
 7120 Building frame and related trades workers
 7121 Builders, traditional materials
 7122 Bricklayers and stonemasons
 7123 Concrete placers, concrete finishers and related workers
 7124 Carpenters and joiners
 7129 Building frame and related trades workers not elsewhere classified
 7130 Building finishers and related trades workers
 7131 Roofers
 7132 Floor layers and tile setters
 7133 Plasterers
 7134 Insulation workers
 7135 Glaziers
 7136 Plumbers and pipe fitters
 7137 Building and related electricians
 7139 Building finishers and related workers
 7140 Painters, building structure cleaners and related workers
 7141 Painters and related workers
 7142 Varnishers and related painters
 7143 Building structure cleaners
 7200 Metal, machinery and related trades workers
 7210 Metal moulders, welders, sheetmetal workers, structural-metal preparers, and related trades workers
 7211 Metal moulders and coremakers
 7212 Welders and flamecutters
 7213 Sheet-metal workers
 7214 Structural-metal preparers and erectors
 7215 Riggers and cable splicers
 7216 Underwater workers
 7220 Blacksmiths, tool-makers and related trades workers
 7221 Blacksmiths, hammer-smiths and forging-press workers
 7222 Tool-makers and related workers
 7223 Machine-tool setters and setter-operators
 7224 Metal wheel-grinders, polishers and tool sharpeners
 7230 Machinery mechanics and fitters
 7231 Motor vehicle mechanics and fitters
 7232 Aircraft engine mechanics and fitters
 7233 Agricultural- or industrial-machinery mechanics and fitters
 7240 Electrical and electronic equipment mechanics and fitters
 7241 Electrical mechanics and fitters
 7242 Electronics fitters
 7243 Electronics mechanics and servicers
 7244 Telegraph and telephone installers and servicers
 7245 Electrical line installers, repairers and cable jointers
 7300 Precision, handicraft, printing and related trades workers
 7310 Precision workers in metal and related materials
 7311 Precision-instrument makers and repairers
 7312 Musical-instrument makers and tuners
 7313 Jewellery and precious-metal workers
 7320 Potters, glass-makers and related trades workers
 7321 Abrasive wheel formers, potters and related workers
 7322 Glass-makers, cutters, grinders and finishers
 7323 Glass engravers and etchers
 7324 Glass, ceramics and related decorative painters
 7330 Handicraft workers in wood, textile, leather and related materials
 7331 Handicraft workers in wood and related materials
 7332 Handicraft workers in textile, leather and related materials
 7340 Printing and related trades workers

Note 0001

(continued)

7341 Compositors, typesetters and related workers
 7342 Stereotypers, and electrotypers
 7343 Printing engravers and etchers
 7344 Photographic and related workers
 7345 Bookbinders and related workers
 7346 Silk-screen, block and textile printers

7400 Other craft and related trades workers
 7410 Food processing and related trades workers
 7411 Butchers, fishmongers and related food preparers
 7412 Bakers, pastry-cooks and confectionary makers
 7413 Dairy-products makers
 7414 Fruit, vegetable and related preservers
 7415 Food and beverage tasters and graders
 7416 Tobacco preparers and tobacco products makers
 7420 Wood treaters, cabinet-makers and related trades workers
 7421 Wood treaters
 7422 Cabinet-makers and related workers
 7423 Woodworking-machine setters and setter-operators
 7424 Basketry weavers, brush makers and related workers
 7430 Textile, garment and related trades workers
 7431 Fibre preparers
 7432 Weavers, knitters and related workers
 7433 Tailors, dressmakers and hatters
 7434 Furriers and related workers
 7435 Textile, leather and related pattern-makers and cutters
 7436 Sewers, embroiderers and related workers
 7437 Upholsterers and related workers
 7440 Pelt, leather and shoemaking trades workers
 7441 Pelt dressers, tanners and fellmongers
 7442 Shoe-makers and related workers
 7500 Metal worker general
 7510 Metal worker n.e.c.
 7520 Electronics engineers n.e.c.
 7900 Master craftsman, supervisor

Plant and machine operators and assemblers

8000 Stationary-plant and related operators
 8100 Stationary-plant and related operators
 8110 Mining- and mineral-processing-plant operators
 8111 Mining-plant operators
 8112 Mineral-ore and stone-processing-plant operators
 8113 Well drillers and borers and related workers
 8120 Metal-processing-plant operators
 8121 Ore ad metal furnace operators
 8122 Metal melters, casters and rolling-mill operators
 8123 Metal-heat-treating-plant operators
 8124 Metal drawers and extruders
 8130 Glass, ceramics and related plant operators
 8131 Glass and ceramics kiln and related machine operators
 8139 Glass, ceramics and related plant operators
 not elsewhere classified
 8140 Wood-processing- and papermaking-plant operators
 8141 Wood-processing-plant operators
 8142 Paper-pulp plant operators
 8143 Papermaking-plant operators
 8150 Chemical-processing-plant operators
 8151 Crushing-, grinding- and chemical-mixing-machinery
 operators
 8152 Chemical-heat-treating-plant operators
 8153 Chemical-filtering- and separating-equipment
 operators
 8154 Chemical-still and reactor operators (except
 petroleum and natural gas)
 8155 Petroleum- and natural-gas-refining-plant operators
 8159 Chemical-processing-plant operators not
 elsewhere classified
 8160 Power-production and related plant operators
 8161 Power-production plant operators
 8162 Steam-engine and boiler operators
 8163 Incinerator, water-treatment and related plant
 operators
 8170 Automated-assembly-line and industrial-robot operators
 8171 Automated-assembly-line operators
 8172 Industrial-robot operators

Note 0001

(continued)

- 8200 Machine operators and assemblers
 8210 Metal- and mineral-products machine operators
 8211 Machine-tool operators
 8212 Cement and other mineral products machine operators
 8220 Chemical-products machine operators
 8221 Pharmaceutical- and toiletry products machine operators
 8222 Ammunition- and explosive-products machine operators
 8223 Metal finishing-, plating- and coating-machine operators
 8224 Photographic-products machine operators
 8229 Chemical-products machine operators not elsewhere classified
 8230 Rubber- and plastic-products machine operators
 8231 Rubber-products machine operators
 8232 Plastic-products machine operators
 8240 Wood-products machine operators
 8250 Printing-, binding- and paper-products machine operators
 8251 Printing-machine operators
 8252 Bookbinding-machine operators
 8253 Paper-products machine operators
 8260 Textile-, fur- and leather-products machine operators
 8261 Fibre-preparing-, spinning- and winding-machine operators
 8262 Weaving- and knitting-machine operators
 8263 Sewing-machine operators
 8264 Bleaching-, dyeing- and cleaning-machine operators
 8265 Fur- and leather-preparing-machine operators
 8266 Shoemaking- and related machine operators
 8269 Textile-, fur- and leather-products machine operators not elsewhere classified
 8270 Food and related products machine operators
 8271 Meat- and fish-processing-machine operators
 8272 Dairy-products machine operators
 8273 Grain- and spice-milling-machine operators
 8274 Baked-goods, cereal and chocolate-products machine operators
 8275 Fruit-, vegetable- and nut-processing-machine operators
 8276 Sugar production machine operators
 8277 Tea-, coffee-, and cocoa-processing-machine operators
 8278 Brewers-, wine and other beverage machine operators
 8279 Tobacco production machine operators
 8280 Assemblers
 8281 Mechanical-machinery assemblers
 8282 Electrical-equipment assemblers
 8283 Electronic-equipment assemblers
 8284 Metal-, rubber- and plastic-products assemblers
 8285 Wood and related products assemblers
 8286 Paperboard, textile and related products assemblers
 8287 Composite products assemblers
 8290 Other machine operators and Assemblers

 8300 Drivers and mobile-plant operators
 8310 Locomotive-engine drivers and related workers
 8311 Locomotive-engine drivers
 8312 Railway brakers, signallers and shunters
 8320 Motor-vehicle drivers
 8321 Motor-cycle drivers
 8322 Car, taxi and van drivers
 8323 Bus and tram drivers
 8324 Heavy truck and lorry drivers
 8330 Agricultural and other mobile-plant operators
 8331 Motorised farm and forestry plant operators
 8332 Earth-moving- and related plant operators
 8333 Crane, hoist and related plant operators
 8334 Lifting-truck operators
 8340 Ship's deck crews and related workers

Elementary occupations

- 9000 Elementary occupations, unskilled workers
 9100 Sales and services elementary occupations

Note 0001

(continued)

- 9110 Street vendors and related workers
 9111 Street food vendors
 9112 Street vendors, non-food products
 9113 Door-to-door and telephone salespersons
 9120 Shoe cleaning and other street services elementary occupations
 9130 Domestic and related helpers, cleaners and launderers
 9131 Domestic helpers and cleaners
 9132 Helpers and cleaners in offices, hotels and other establishments
 9133 Hand-launderers and pressers
 9140 Building caretakers, window and related cleaners
 9141 Building caretakers
 9142 Vehicle, window and related cleaners
 9150 Messengers, porters, doorkeepers and related workers
 9151 Messengers, package, and luggage porters and deliverers
 9152 Doorkeepers, watchpersons, and related workers
 9153 Vending-machine money collectors, meter readers and related workers
 9160 Garbage collectors and related labourers
 9161 Garbage collectors
 9162 Sweepers and related labourers
 9200 Agricultural, fishery and realted labourers
 9210 Agricultural, fishery and related labourers
 9211 Farm-hands and labourers
 9212 Forestry labourers
 9213 Fishery, hunting and trapping labourers
 9300 Labourers in mining construction manufacturing and transport
 9310 Mining and construction labourers
 9311 Mining and quarrying labourers
 9312 Construction and maintenance labourers: roads, dams and similar constructions
 9313 Building construction labourers
 9320 Manufacturing labourers
 9321 Assembling labourers
 9322 Hand packers and other manufacturing labourers
 9330 Transport labourers and freight handlers
 9331 Hand or pedal vehicle drivers
 9332 Drivers of animal-drawn vehicles and machinery
 9333 Freight handlers

Country specific codes

Germany

- 0001 Soldiers
 0002 Officers

Hungary, Poland

- 1250 Military officers
 1251 High-grade military officers (captain and above)
 1252 Lower grade commissioned officers (incl. Army Lieutenant)
 3452 Armed forces non-commissioned officer
 5164 Armed forces, soldiers

Hungary

- 2321 Secondary (high-)school teacher (academic track)
 2322 Teacher in vocational training

United States

- 1240 Miscellaneous office supervisors
 6132 Farmers
 6133 Farm supervisors

Norway

- 0111 Soldiers
 0112 Officers
 1320 Managers/ leaders in non-specified trade-areas
 2510 Social scientific, juridical and technical deliberation and planning

Note 0001

(continued)

- 2511 Economical and social scientific planning and deliberation
2512 Juridical planning and deliberation
2513 Technical and scientific planning and deliberation
2519 Others within this group
3341 Teachers in technical college
3342 Other educational and pedagogical occupations
3418 Customer consultant in a bank
3445 Public employment service workers
3491 Information workers and journalists
3492 Librarians
4116 Clerical officer
5134 Dental secretaries
5135 Medical secretaries
5136 Childminders
5164 Caretakers/ houseporters
5221 Shop staff/ sales staff and other salesmen (detail)
5222 Door-to-door and telephone salesmen
5223 Wholesale merchants
7125 Joiner, formwork
7126 Carpenters
7127 Foundation workers
7128 Tunnel and mountain workers, blasting operators
7144 Chimney sweepers
7217 Car- and airstructure mechanics
7234 Shipmechanics etc.
7350 Technical drawers
7450 Laboratory assistants
8132 Operators in insulation glass production
8341 Deck crew (ship)
8342 Engine crew (ship)
9134 Kitchen and serving assistants

Note 0002

This Note refers to V254 and contains specific explanations about size and type of the place of residence.

United States

NORC size of place

Source: GSS Methodological Report No.4.

Within an SMSA and --

- 01 A large central city (over 250.000)
- 02 A medium size central city (50.000 to 250.000)
- 03 A suburb of a large central city (a)
- 04 A suburb of a medium size central city
- 05 An unincorporated area of a large central city
(division, township, etc.)
- 06 An unincorporated area of a medium central city

Not within an SMSA, (within a country) and --

- 07 A small city (10.000 to 49.999) (b)
- 08 A town or village (2.500 to 9.999)
- 09 An incorporated area less than 2.500 or an unincorporated area of 1.000 to 2.499 (c)
- 10 Open country within larger civil divisions, e.g. township, division

Remarks:

- (a) A suburb is defined as any incorporated area or unincorporated area of 1.000+ (or listed as such in the U.S. Census PC (1)-A books) within the boundaries of an SMSA but not within the limits of a central city of the SMSA. Some SMSAs have more than one central city, e.g., Minneapolis-St. Paul. In these cases, both cities are coded as central cities.
- (b) If such an instance were to arise, a city of 50.000 or over which is not part of an SMSA would be coded '07'.
- (c) Unincorporated areas of over 2.499 are treated as incorporated areas of the same size. Unincorporated areas under 1.000 are not listed by the Census and are treated here as part of the next larger civil division, usually the township.

Hungary

- 1 Central city (or suburb of a city)
Budapest and the 5 major towns of the country
(Miskolc, Szeged, Debrecen, Pecs and Gyor)
- 2 Smaller city (or suburb of a smaller city)
All other minor towns
- 3 Rural
Large and small villages
